MDAR Reproducibility Checklist

S1 Materials and Methods

This study is part of a broader set of experimental and observational studies, the U.S. 2020 Facebook and Instagram Election Study (FIES), that occurred as a result of a collaboration between academics and Meta (the company formerly known as Facebook) (see Section S11). In this Materials and Methods section, we provide information specific to the No Reshares treatment intervention. This intervention only took place on the Facebook platform; other studies part of this collaboration also took place on the Instagram platform. Information that is common across multiple studies of this collaboration (e.g., sampling, randomization, weights) is mainly contained in subsequent sections of this SM. Some of this information references Instagram where relevant.

S1.1 Experimental Design

Respondents consisted of Facebook users age 18 and over located in the U.S. who agreed to participate in a study of social media and politics and completed both baseline survey waves (Wave 1 and Wave 2) ($N = 29,072$). As Figure S1, the flow diagram of the enrollment, intervention allocation, follow-up, and analysis phases of the No Reshares treatment intervention, shows, 22.97 million Facebook users were determined to be eligible for “On-platform Interventions” or “On-platform experiments” taking place on Facebook (for details on Sampling, see Section S8.1 and S8.3. These users were shown survey invitations placed at the top of their feeds (see Section S8.2). However, during the recruitment period, 8.32 million users never saw the survey invitation, and 13.65 million users did not click on the invitation. Of those who did click on the invitation, 794,454 declined to participate, 62,297 did not meet the inclusion criteria, and the remaining 56,220 could not participate due to other reasons (e.g., did not complete baseline survey Wave 1 and Wave 2).

A total of 75,189 Facebook users who consented to participate and who completed the two baseline survey waves were randomized into one of eight groups that make up the On-Platform Interventions (see Section S8.4). The No Reshares intervention group ($N = 8,985$), along with four other intervention groups,^{S1} shared one control group ($N = 20,087$), while the two other groups were the Untrustworthy Sources Holdout Control group and Untrustworthy Sources Holdout intervention group. The impact of these interventions is analyzed in separate papers that were also pre-registered separately. The intervention group presenting posts in users’ Feeds in chronological order (Chronological Feed) is described in the same pre-analysis plan as the No Reshares intervention, but results of the Chronological Feed intervention will also be analyzed in a separate paper.

In the Control group, no changes were made to users’ Facebook Feeds, while in the No Reshares intervention group, no reshared content (from users, Pages or Groups) was shown in users’ Feeds. This implied that participants in the No Reshares treatment group were only

^{S1}Chronological Feed; Like-minded Sources Demotion; Social Issues, Elections or Politics (SIEP) Ad Removal; and Custom SIEP Ad Removal.

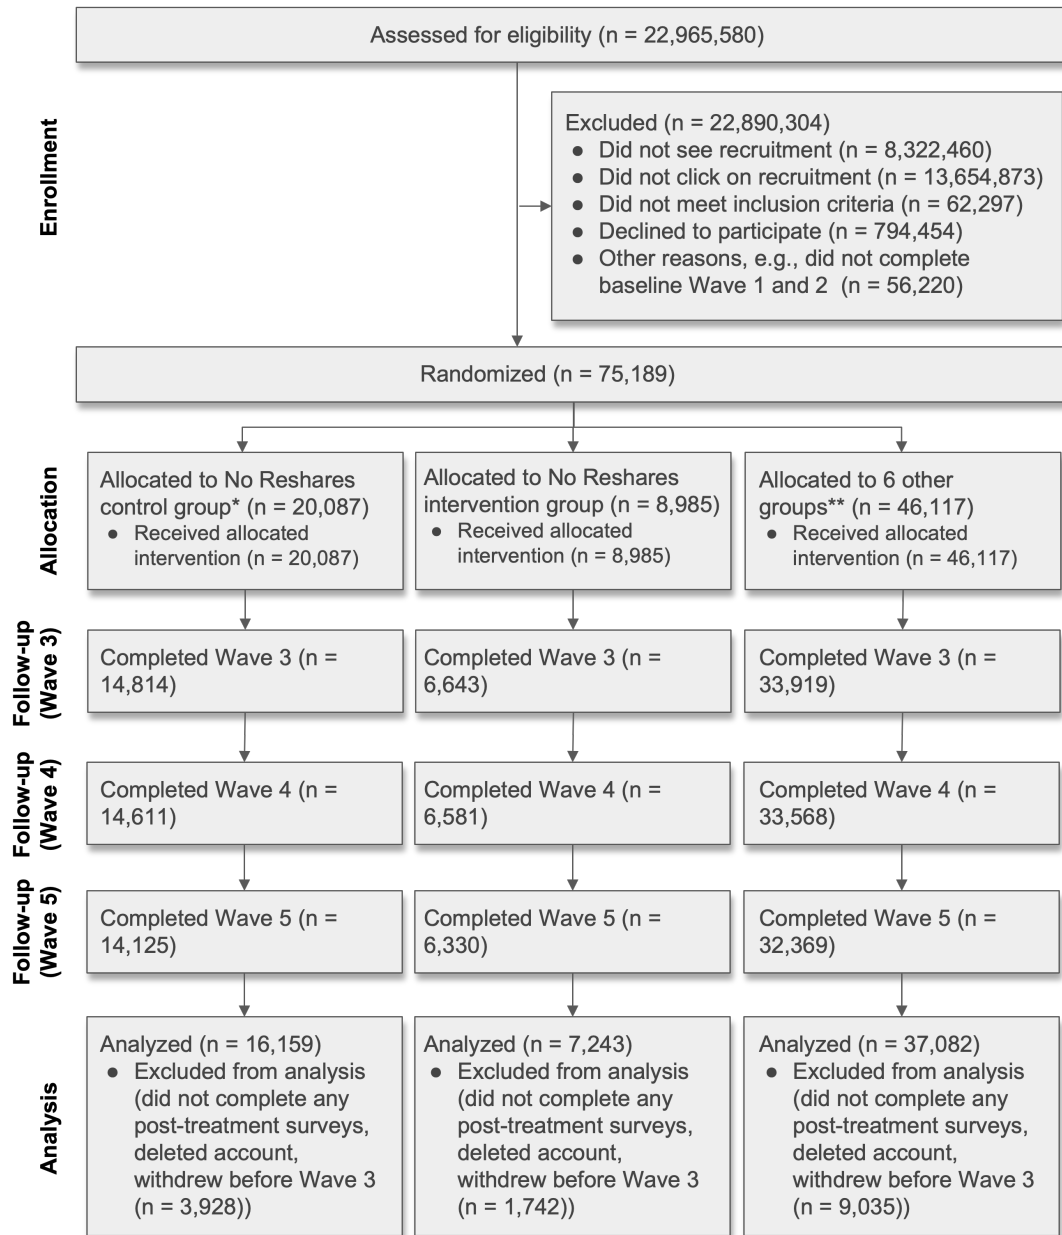

Figure S1: CONSORT Flow diagram for the No Reshares experiment.

* Control group for the No Reshares intervention is also Control group for Chronological Feed; Like-minded Sources Demotion; Social Issues, Elections or Politics (SIEP) Ad Removal; and Custom SIEP Ad Removal intervention groups, which are analyzed in other papers.

** Other groups include: 1) Chronological Feed, 2) Like-minded Sources Demotion, 3) All SIEP Ad Removal, and 4) Custom SIEP Ad Removal, as well as 5) Untrustworthy Sources Holdout Control group, and 6) Untrustworthy Sources Holdout intervention group (last two groups constructed using a different sampling and randomization scheme, see Sections S8.1 and S8.3).

exposed to original content created by their friends and the Pages they choose to follow, as well as shared in the Groups they are members of. The platform intervention began on September 24, 2020, and ended halfway through the day on December 23, 2020. For additional details on randomization, see Section S8.4 of the SM.

In addition to the baseline Wave 1 and 2 surveys, which were completed prior to randomization, users were invited to complete three additional surveys during the treatment period (see Figure S2 for timeline and Section S8.6 for additional details on the timing of data collection). Participants also agreed to allow their on-platform activity to be used for the research project. Finally, some users agreed to install software that tracked their app usage and web domain visits off platform (see Section S9). The analysis for this paper is based on “study-completes,” participants who completed the baseline Wave 1 and 2 surveys and at least one of the three surveys (Wave 3 or Wave 4 or Wave 5) conducted during the treatment period ($N = 16,159$ analyzed in the Control group and $N = 7,243$ analyzed in the No Reshares intervention group).^{S2} For additional details on response rates, see Section S8.7. Full questionnaires for all survey waves

Figure S2: Study Timeline.

can be found in Section S14 of the SM.

S1.2 Ethics

Study participants provided informed consent (see Section S8.2 for recruitment and consent materials for the experiment; see Section S9 for materials related to the collection of off-platform activity data). Participants were given the option to withdraw from the study while the experiment was ongoing (i.e., participants in the No Reshares treatment group could revert to

^{S2}Note that study-completes is different from “three-wave completes” described in Section S8.1, which were used to calculate minimum detectable effects.

a default feed where reshared content was displayed) as well as to withdraw their data (even if they participated in the full study) at any time up until their survey responses were disconnected from any identifying information. External researchers could only access de-identified data when conducting analyses. The entire study was reviewed and approved by the NORC IRB. Academic researchers' involvement in analyzing data collected by NORC and Meta were reviewed by IRBs at their institutions. The research team also received ethical guidance from the independent firm Ethical Resolve to inform study designs. See the SM Section [S12](#) for additional discussion of ethical and privacy considerations. The lead authors with final control rights retain final discretion over everything reported in this paper. Meta did not have the right to pre-publication approval.

S1.3 Pre-registered Hypotheses

In advance of data collection, we pre-registered all hypotheses, data collection procedures, and statistical analyses. The pre-analysis plan, initially filed on OSF on September 24, 2020, can be found at <https://osf.io/9t67d>. A revised pre-analysis plan was filed in December 2020 immediately prior to the fielding of Wave 5 of the survey to incorporate new questions relating to the post-election period, updated question wordings from Waves 3–4, and details related to web tracking data. A second revision was posted in February 2021 to incorporate data on participants' Twitter usage and outcomes related to political violence. These revisions were not informed by any analysis of study data and were primarily concerned with the availability of additional data sources (e.g., Twitter, updated survey question wording). Deviations from the final version of the pre-analysis plan, with explanations of these revisions, are listed in Section [S13](#) of the SM. Section [S2](#) of the SM contains all results outlined in the pre-analysis plan.

We pre-registered one research question (i.e., auxiliary hypothesis) and two primary hypotheses:

- RQ (auxiliary hypothesis): How will holding out reshared content impact the type of content people see on their feeds?
- H1: Holding out reshared content will reduce polarization and negative perceptions of outgroups.
- H2: Holding out reshared content will reduce campaign knowledge.

We additionally pre-registered a set of secondary hypotheses (SH). All statistical tests are adjusted for multiple comparisons (see Section [S1.11](#) below).

S1.4 Descriptive Statistics

The following data on users' activity on Facebook were used to describe the impact of the treatment: (1) exposure-based metrics; (2) engagement-based metrics; (3) production metrics;

(4) network metrics; and (5) time spent on platform and off platform. How these on-platform behaviors were coded can be found in Section S6 of the SM.

S1.5 Outcome Measures

Per our pre-analysis plan (<https://osf.io/9t67d>), composite scales referenced below were constructed using principal components analysis with varimax rotation from the candidate items in the list. (See Section S5 for associated factor loadings.)

The following data on users' activity on Facebook were used as outcome measures: (1) the percentage of the feed that is comprised of political content (based on the "Civic classifier"); (2) the percentage of the feed from cross-cutting, like-minded, and moderate/mixed sources (based on the "Ideology classifier"); (3) the percentage of the feed that is news and political news (based on the "News classifier"); (4) the percentage of the feed that is from untrustworthy sources (based on definitions for "Untrustworthy Sources"); (5) the percentage of the feed that is uncivil (based on the "Incivility classifier"); (6) the percentage of the feed that is content with slur words (based on the "Content with slur words classification method"). How these content characteristics were defined and estimated can be found in Section S7 of the SM.

For survey-based measures, we report survey item codes that correspond to the exact question wordings found in the full questionnaires in Section S14 of the SM. In the item names below, W1 and W2 indicate survey items in Wave 1 and Wave 2, which we used to construct pre-treatment versions of the outcome measures.

To evaluate H1, we leverage survey measures of affective polarization and issue polarization. All the metrics below exclude respondents who do not lean towards any party. The affective polarization scale is comprised of the following items:

1. Difference in feeling thermometer scores between people who support the party the respondent prefers (0–100) and people who support the other party (0–100) (PID_W1; FT_PEOPLEGROUPSC_W2; FT_PEOPLEGROUPSD_W2; FT_PEOPLEGROUPSC_W3; FT_PEOPLEGROUPSD_W3; FT_PEOPC_W4; FT_PEOPD_W4; FT_PEOPC_W5; FT_PEOPD_W5)
2. Difference in feeling thermometer scores between people running for office on behalf of the party the respondent prefers (0–100) and people running for office from the other party (0–100) (FT_PEOPLEGROUPSE_W2; FT_PEOPLEGROUPSF_W2; FT_PEOPLEGROUPSE_W3; FT_PEOPLEGROUPSF_W3; FT_PEOPC_W4; FT_PEOPD_W4; FT_PEOPC_W5; FT_PEOPD_W5)
3. Difference in perceptions of how smart people are who support the party the respondent prefers and people who support the other party (1–5 where 5 indicates "extremely smart" for both) (DEMSMART_W2; REPSMART_W2; DEMSMART_W4; REPSMART_W4)

The issue polarization scale is comprised of a composite index of responses to six issue opinion questions re-signed so that, on each question, higher values are closer to the own-party mean and lower values are closer to the other-party mean. The issues are: immigration, healthcare, unemployment, COVID-19 restrictions, perceptions of racial discrimination, and perceptions of

gender discrimination (IMMIG_W4; HEALTH_W4; UNEMPLOY_W4; COVID_W4; BLACK-WHITEA_W4; BLACKWHITEB_W4; BLACKWHITEC_W4; BLACKWHITED_W4; SEXISM1_2A_W4; SEXISM1_2B_W4). Per procedures outlined in the pre-analysis plan, items related to policing and foreign policy (FOREIGN_W4; POLICE_W4) were excluded from the scale because factor analysis showed that they did not load with the others (see Section S5 for factor loadings of all survey scales).

To evaluate H2, we construct composite (summed) indices for two campaign knowledge batteries based on the number of correct responses: (1) election knowledge, and (2) news knowledge. The election knowledge index asked respondents to report whether Donald Trump and/or Joe Biden supported various policy positions (SPECKNOWPOA_W4; SPECKNOWPOB_W4; SPECKNOWPOC_W4; SPECKNOWPOD_W4; SPECKNOWPOE_W4; SPECKNOWPOF_W4). The news knowledge index asked respondents to report whether seven news events did or did not occur (SPECKNOWEVA_W4; SPECKNOWEVB_W4; SPECKNOWEVC_W4; SPECKNOWEVD_W4; SPECKNOWEVE_W4; SPECKNOWEVF_W4; SPECKNOWEVG_W4).

We next turn to the secondary hypotheses (SH). To evaluate SH1a on levels of knowledge and (mis)information, which we label ‘factual discernment’ in the manuscript, we construct a scale based on calculations of the difference between mean belief in six true claims (MISINFO1_W4; MISINFOB_W4; MISINFOJ_W4; MISINFOH_W4; MISINFO3_W3; MISINFO4_W3) and mean belief in ten false claims (MISINFOA_W4; MISINFOK_W4; MISINFOC_W4; MISINFOG_W4; MISINFOE_W4; MISINFOD_W4; MISINFOF_W4; MISINFO5_W3; MISINFO6_W3; MISINFO7_W3) that were circulating online at the time of the study. Perceived accuracy was measured on a four-point scale. Separately, to evaluate SH1b on online consumption of political news, we measure the count of visits to political news domains based on passive tracking data (see section S9 for details).

To evaluate SH2a on trust in mainstream and liberal media, we create an index based on respondents’ trust in various traditional media outlets: local news, national newspapers, national network TV news, MSNBC, and CNN (INFOTRUST_SOURCEA_W2; INFOTRUST_SOURCEB_W2; INFOTRUST_SOURCEF_W2; INFOTRUST_SOURCEG_W2; INFOTRUST_SOURCEH_W2; INFOTRUSTA_W4; INFOTRUSTB_W4; INFOTRUSTF_W4; INFOTRUSTG_W4; INFOTRUSTH_W4; INFOTRUSTA_W5; INFOTRUSTB_W5; INFOTRUSTF_W5; INFOTRUSTG_W5; INFOTRUSTH_W5). Per the pre-analysis plan, we dropped an item on trust in Fox News because it did not load with the other items (INFOTRUST_SOURCEI_W2; INFOTRUSTI_W4; INFOTRUSTI_W4).

To evaluate SH2b on trust in social media, we create an index based on respondents’ trust in Facebook, Instagram, and Twitter (INFOTRUST_SOURCEC_W2; INFOTRUST_SOURCED_W2; INFOTRUST_SOURCEE_W2; INFOTRUSTC_W4; INFOTRUSTD_W4; INFOTRUSTE_W4; INFOTRUSTC_W5; INFOTRUSTD_W5; INFOTRUSTE_W5).

To evaluate SH2c on confidence in institutions, we create an index based on respondents’ confidence in the presidency/executive branch, Congress, police, the Supreme Court, local government, state government, and large corporations (CONFINSTA_W3; CONFINSTB_W3; CONFINSTC_W3; CONFINSTD_W3; CONFINSTE_W3; CONFINSTF_W3; CONFINSTH_W3; CONFINSTA_W5; CONFINSTB_W5; CONFINSTC_W5; CONFINSTD_W5; CONFINSTE_W5;

CONFINSTF_W5; CONFINSTH_W5). Per the pre-analysis plan, we dropped an item on confidence in the scientific community because it did not load with the other items (CONFINSTG_W3; CONFINSTG_W5).

To evaluate SH3, we examine the effects of our intervention on three additional indicators of polarization. We measure the ideological extremity of each respondent's media diet by computing the absolute difference between the average domain audience ideology of political news domains that respondents (1) clicked on in their feed, and (2) visited, based on passive tracking data (see section S9 for details), and the mid-point of the domain audience ideology scale (0.50). We refer to these metrics as (1) "partisan news clicks" and (2) "partisan news visits" in the manuscript. We measure perceived polarization by calculating the average absolute difference in perceived ideology between: (a) people who support each of the parties; (b) people running for office from the two parties; and (c) people from the two parties the respondent sees on Facebook (IDEOLOGY_GROUPD_W2; IDEOLOGY_GROUPE_W2; IDEO_GRPD_W4; IDEO_GRE_W4; IDEOLOGY_GROUPB_W2; IDEOLOGY_GROUPE_W2; IDEO_GRPB_W4; IDEO_GRC_W4); IDEOLOGY_GROUPF_W2; IDEOLOGY_GROUPE_W2; IDEO_GRPB_W4; IDEO_GRC_W4). We refer to these two metrics as "partisan news clicks" and "partisan news visits" in the manuscript.

To evaluate SH4, we create an index of political efficacy based on measures of respondents' confidence in their ability to find the truth about political issues (EPE1_W2; EPE1_W4), and figure out the facts behind most political disputes (EPE2_W2; EPE2_W4).

To evaluate SH5, we measure self-reported presidential vote choice, coded 1 if consistent with their own party identification (including leaners) (PID_W1), and 0 if otherwise (VOTE_PREELEC_W2; VOTE_POST_W4; VOTE_POST_W5). We measure consistency of self-reported vote choice in down-ballot races as the sum of votes that are consistent with party identification (including leaners) divided by the total number of non-missing responses on these items (VOTESENATE_W4; VOTESENATE_W5; VOTESENATE2_W4; VOTESENATE2_W5; VOTEHOUSE_W4; VOTEHOUSE_W5; VOTEGOV_W4; VOTEGOV_W5). We refer to these two metrics as "party-line presidential voting" and "party-line downballot voting" in the manuscript.

To evaluate SH6 on belief in the legitimacy of the election, we construct an index of various election-related beliefs and attitudes including belief in who won the 2020 presidential election, perceptions of election irregularities, confidence in election officials, and perceived accuracy of election results and mail-in voting (ELECTWIN_W5; IRREG2020A_W5; IRREG2020B_W5; MISINFOA_W5; MISINFOB_W5; MISINFOC_W5; MISINFOD_W5; MISINFOE_W5; CONFOFFICIALS_W5; COUNTACCURATE_W5; MAILACCURATE_W5).

Lastly, to evaluate SH7 on support for political violence, we analyze responses to a single survey question on whether violence is appropriate in contesting election results (POLVIOLENCE_W3; POLVIOLENCE_W5).

S1.6 Moderators and HTE

In our pre-analysis plan, we pre-registered three primary moderators to assess heterogeneous treatment effects: (1) party identification measured on a three-point scale (PID_W1; PIDLEAN_W1);

(2) a digital literacy index composed of eight items with respondents separated into terciles (DIGLITERACY_TERMA_W2; DIGLITERACY_TERMB_W2; DIGLITERACY_TERMC_W2; DIGLITERACY_TERMD_W2; DIGLITERACY_TERME_W2; DIGLITERACY_TERMF_W2; DIGLITERACY_TERMG_W2; DIGLITERACY_TERMH_W2); and (3) a three-point measure of political interest (originally based on a five-point scale with the bottom three response categories collapsed into one) (POLINT_W2). We also committed to assess heterogeneous treatment effects for a set of secondary moderators: age (AGE_V2), gender (GENDER), and race bifurcated by non-Hispanic whites / others (RACETHNICITY).

We use a nonparametric two-stage regression procedure that has been proven to be statistically optimal under weak conditions (28) — and under essentially no conditions in an experiment. It reduces to the well-known semiparametric efficient augmented inverse-probability-weighted (AIPW) estimator in the case of discrete moderators. See Section S4 for more details on this procedure.

S1.7 Covariate Balance

Following the Green Lab SOP (29), we tested whether observed covariate imbalances are larger than would normally be expected from chance alone. To do so, we estimated an OLS regression of the treatment indicator on covariates used in our main estimation models (see Section S1.11) and, via randomization inference, tested the hypothesis that all the coefficients on the covariates (excluding block dummies) are zero. The p -value is above the pre-registered threshold for statistical significance ($p < 0.05$) and represents small substantive differences ($p = 0.24$).

We also report standard balance tables — shown below — in which covariate proportions are listed in rows and columns corresponding to the control and treatment arms. The last two columns contain the treatment-control difference and a p -value for a t -test of the difference in means. Generally we find that the treatment and control groups for both samples have nearly identical values. Some of the differences are statistically significant, which is expected given the number of tests and the sample size, but in absolute terms any differences are small.

Table S1: Covariate balance

	% in Control	% in Treatment	% Diff.	p(diff!=0)
Variables used for block randomization				
% in swing state	0.35	0.35	0.00	0.99
% not in swing state	0.65	0.65	-0.00	0.99
% in low friend count bucket	0.33	0.33	0.00	0.74
% in mid friend count bucket	0.33	0.33	0.00	0.98
% in high friend count bucket	0.34	0.33	0.00	0.76
% white race	0.72	0.72	-0.00	0.89
% non-white race	0.28	0.28	0.00	0.89
Other covariates				
% age 18-29	0.19	0.18	0.01	0.03
% age 30-44	0.42	0.43	-0.01	0.17
% age 45-65	0.33	0.33	-0.00	0.92
% age >65	0.07	0.07	-0.00	0.64
% female	0.56	0.56	-0.00	0.57
% male	0.43	0.43	0.00	0.88
% other gender	0.01	0.01	0.00	0.01
% Democrats	0.52	0.52	0.00	0.82
% Republicans	0.35	0.35	-0.00	0.85
% no party ID / others	0.13	0.13	0.00	0.95
% no college degree	0.52	0.53	-0.01	0.17
% with college degree	0.48	0.47	0.01	0.17
% Black, non-Hispanic	0.07	0.07	0.00	0.54
% white, non-Hispanic	0.72	0.72	-0.00	0.85
% Hispanic	0.12	0.13	-0.00	0.33
% other race	0.08	0.08	0.00	0.35
% 1st income tercile	0.34	0.34	-0.00	0.89
% 2nd income tercile	0.34	0.35	-0.01	0.19
% 3rd income tercile	0.32	0.31	0.01	0.14

S1.8 Compliance and Manipulation Checks

As shown in Figures S3 and S4, the manipulation was successful. On average, 5.8% of views in the No Reshares treatment group were of reshared content; this proportion was 28% in the control group. This difference is statistically significant ($p < 0.01$) and is not present in the pre-treatment period ($p = 0.36$), during which both groups had roughly 31.6% of views of reshared content.

In absolute terms, we find that respondents in the treatment group saw 15.3 reshared posts on average each day, whereas respondents in the control group saw 74.7 reshared posts (approximately 80% reduction). This difference is statistically significant ($p < 0.01$). In contrast, during the pre-treatment period both groups saw around 84 reshared posts per day, and the difference is not significant. (All these statistics were computed after winsorizing these metrics at the 99% percentile, in order to reduce the influence of outliers.)

As shown in these figures, these differences were not only large on average but also spread out across the entire treatment group and stable in magnitude over time, which confirms that our intervention was largely successful in withholding reshared content to users in the treatment group.

Exposure to reshared content was not completely eliminated in the treatment group for two main reasons. First, participants could still be exposed to reshared posts in their “Most Recent” feed, which was not affected by our intervention. In fact, we see a small but statistical significant difference in the count of views on this chronologically ranked feed across groups: from 2.5% of all views in the control group to 3.2% of all views in the treatment group ($p < 0.01$). And second, due to a technical limitation: the system used to implement the treatment would sometimes display reshared posts if there was no other available content to display to participants, which may be more likely to occur for users with low inventory or those who consumed most content during their Facebook visits.

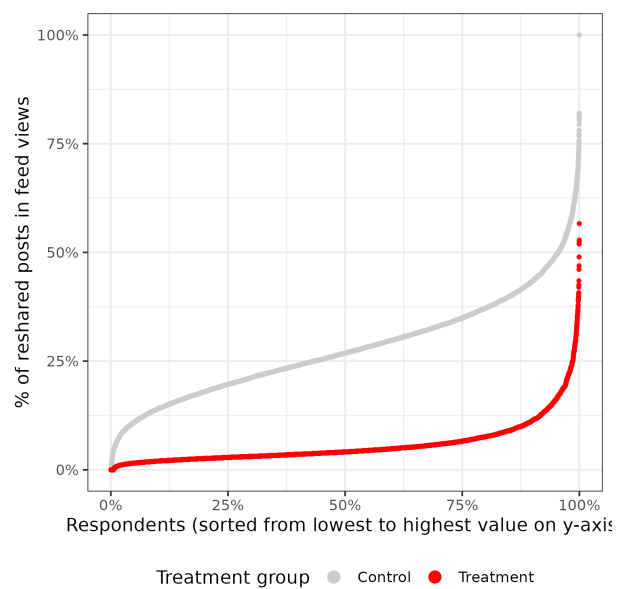

Figure S3: Manipulation check: % of views in News Feed that correspond to reshared posts.

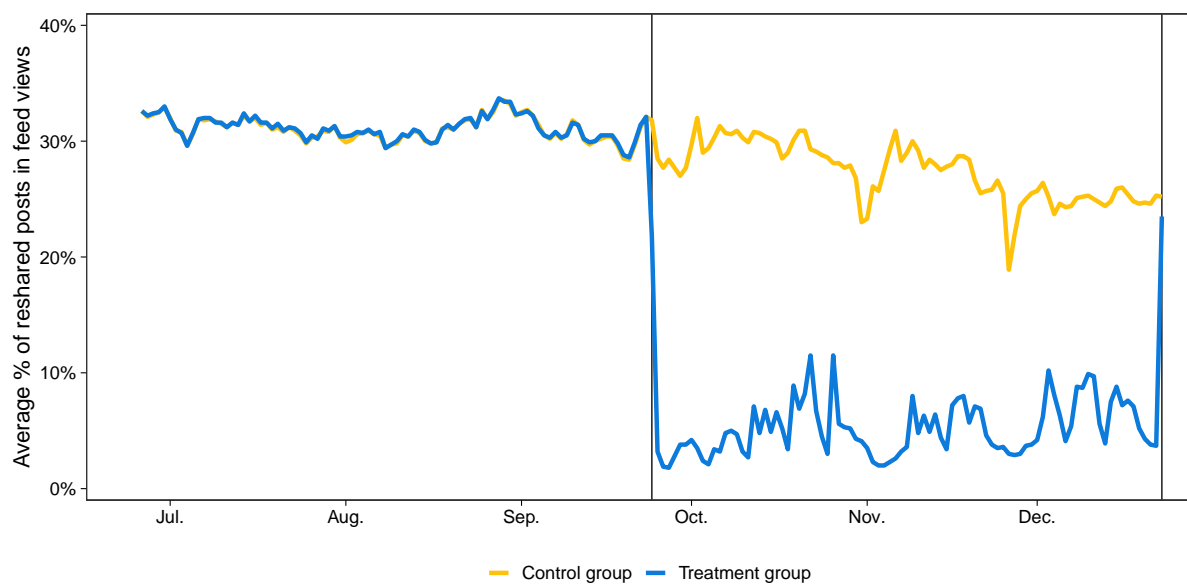

Figure S4: Daily manipulation check.

S1.9 Differential Attrition

We do not find evidence that differential attrition affects the internal validity of our results. 19.5% of participants who were randomized into the control or treatment group after wave 2 of our study did not complete any of the post-treatment waves (waves 3, 4 and 5). This proportion is identical for the two groups and not significantly different ($p = 0.75$). We find similar results when we analyze attrition for our two main post-election waves: the proportion of participants who did not complete wave 4 was 26.7% for the treatment group and 27.2% in the control group ($p = 0.38$); for wave 5 these proportions were 29.5% in the treatment group and 29.7% in the control group ($p = 0.83$).

Table S2 offers a more detailed account of how differential attrition rates varied across waves and demographic groups. Since we do not have demographic information for participants who withdrew from the study or deleted their Facebook account, here we report attrition only for the subsample that excludes these users. For this subsample, we do not find differential attrition overall: 17.4% of participants in both the treatment and control groups did not complete any of the post-treatment waves ($p = 0.93$). Although we find evidence that attrition was higher for specific demographic groups (e.g., for participants in the lowest age cohort, with a high number of friends, who self-identify as Republican, have a college degree), none of the differences between treatment and control within these subsets are statistically significant after adjusting for multiple comparisons.

Table S2: Differential attrition by demographic group, for waves 3, 4, and 5

Demographic group	Wave 3			Wave 4			Wave 5		
	C	T	p	C	T	p	C	T	p
In swing state	24.4%	24.3%	0.90	26.0%	24.9%	0.23	28.4%	28.5%	0.87
Not in swing state	24.2%	24.3%	0.90	24.9%	25.0%	0.86	27.5%	27.5%	0.99

After adjusting for multiple comparisons, all tests have adjusted p=1.00

S1.10 Missing Data

Our pre-analysis plan stated the following regarding how to deal with missing values in our covariates:

- If no more than 10% of the covariate’s values are missing, recode the missing values to the overall mean. (Do not use arm-specific means.)
- If more than 10% of the covariate’s values are missing, include a missingness dummy as an additional covariate in any regression model and recode the missing values to an arbitrary constant, such as 0.

Following this pre-registered procedure, we computed the percentage of missing observations for each covariate used as control variables in our models. None of them had a percentage of missing values above the pre-registered threshold of 10%: missingness ranged from less than 0.01% for covariates such as gender, age bracket, and political interest to 0.3% for self-reported news consumption via newspapers. Based on this, in our analysis we recode the missing values to the overall mean (for continuous variables) or mode (for categorical variables) prior to fitting the models.

S1.11 Estimation of Treatment Effects

We report two specifications: (1) baseline, and (2) saturated regression, which we use for all results in the main text and associated figures; both are specified with post-lasso variable selection. The baseline model uses OLS regression with controls (X_i) selected via lasso, as well as stratum indicators (see SM Section [S8.1](#) for details of strata definitions):

$$Y_i = \alpha + \beta_0 \times Treatment_i + \beta_1 \times X_i + \beta_2 \times StratumDummies_i + \epsilon_i$$

To select covariates, we use lasso (with default options in `cv.glmnet`: 10 folds, seed = 2020) following this procedure:

1. For the lasso model, include pre-treatment dependent variables (if available) and survey-based metrics from wave 1 and wave 2: gender, age, race/ethnicity (non-Hispanic white, Hispanic, non-Hispanic Black, Asian American Pacific Islander, Other), ideology, party ID, turnout in 2016, news consumption [network TV, average of cable, online websites, average of social media (Facebook, Instagram, Twitter, YouTube), newspapers], political interest, sum of political participation, and sum of digital literacy. Stratum indicators and treatment assignment are not included in this model. The model is computed on the full sample (treatment and control units).
2. If one or more levels (e.g., “Northeast”) are selected from a factor variable, we will include only the selected level(s) in the model.

Then for (2), we use Lin regression (30) with covariates selected by the lasso model above, as well as the full list of covariates used for block randomization and the treatment indicator.

For each treatment effect estimate, we use two estimands. We designated the Population Average Treatment Effect (PATE) as the primary estimand shown in the main text of this paper, which is computed using weights. Additionally, we report the Sample Average Treatment Effect (SATE) for the full sample in the SM. For details on weights and calculation of PATE, see SM Section S8.5.

We use two-sided tests with $p < 0.05$ as our measure of statistical significance for all the tests (but also report $p < 0.01$ and $p < 0.005$). Regression analyses use HC2 robust standard errors. We adjust p -values for multiple comparisons by binning groups of hypotheses (e.g., primary, secondary), and implementing sharpened FDR adjustment recommendations in (31) with code adapted from (32) as follows:

- K1 primary outcomes: sharpened FDR-adjusted p -values with these K1 outcomes
- K2 secondary outcomes: sharpened FDR-adjusted p -values with K1+K2 outcomes
- L1 primary tests of heterogeneity: sharpened FDR-adjusted p -values with with $L1 \times K1$ hypothesis tests
- L2 secondary tests of heterogeneity: sharpened FDR-adjusted p -values with $(L1+L2) \times K1$ tests
- Auxiliary tests (e.g., substitution, first stage effects on usage): not adjusted, intended for variables for which statistical significance is not evaluated.

S2 Results of All Pre-registered Analyses

Here, we present all of the analyses outlined in our pre-analysis plan. This section is organized into two parts: 1) descriptive statistics (Section S2.1) and 2) results of the RQ (research question), primary hypotheses, secondary hypotheses, and wave-by-wave results (Section S2.2).

S2.1 Descriptive statistics

We describe how the No Reshares treatment changed the experience of Facebook users compared to the control group. Because the treatment changed many aspects of users' experience on these platforms and affected users' decisions and patterns of behavior, we describe how a number of facets of the experience of users in the treatment group differs from those in the control group.

For each comparison between treatment and control group, we report whether the difference is statistically significant using the same baseline model we use to compute our main treatment effects. Since the purpose of this analysis is to understand the impact of the treatment on the respondents, we do not use weights. Whenever possible, we use listwise deletion across all metrics within a single table in order to facilitate comparisons. In some cases this would not be possible without dropping a large proportion of our sample (for example, whenever we report metrics that are conditional on exposure, which for some respondents might be zero). If listwise deletion is used, this is described in the notes accompanying the table.

In the list of variables below, we use the following definitions:

- “Production metrics” refers to counts of posts.
- “Engagement metrics” refers to bundled counts of (a) comments and reshares, (b) likes and reactions, and (c) clicks. Each of these metrics will be measured separately.
- “Connection type” refers to friends, group membership or page following.
- For additional information on the definitions of political content, news, incivility, and content with slur words, see Section S7.

Time on platform and off-platform

Table S3: Average daily proportional difference in time spent on Facebook, compared to US monthly active users

Metric	Group	p5	p50	p95	Avg.	SD	N	diff

S2.2 Results

This section presents results associated with the pre-registered primary hypotheses, research question, and secondary hypotheses. For each outcome variable, ATEs are reported for the baseline model specification and the saturated model specification. We report both unweighted estimates (SATE) and weighted estimates (PATE) that rely on the weights described in Section S8.5. Note that graphs display confidence intervals that are unadjusted for multiple comparisons; see tables for p-values that incorporate our pre-registered adjustment. Finally, whereas the results in the main text are reported pooling across waves in the post-treatment period, we also report wave-by-wave results here.

Primary hypotheses

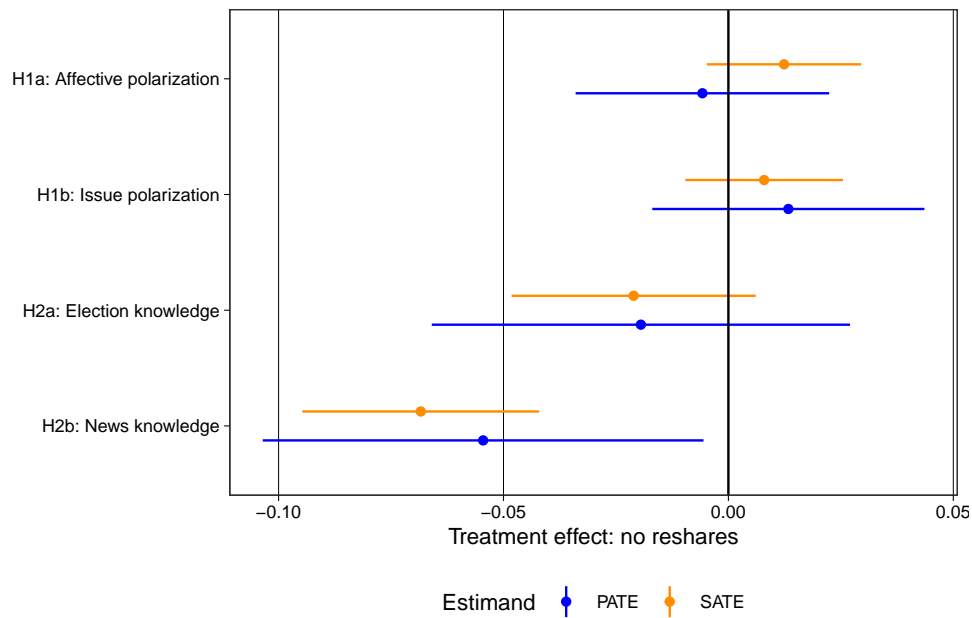

Figure S5: Treatment effect estimates using baseline model specification.

Table S39: Treatment effect estimates for primary hypotheses using baseline model specification

Hypothesis	Est	ATE	95% CI	SE	p	adj.p
H1a: Affective polarization	PATE	-0.006	[-0.034, 0.022]	0.014	0.688	1.000

S3 Additional Results (Not Pre-registered)

S3.1 Descriptive statistics for reshared and non-reshared posts

Table S47 offers additional descriptive analysis to characterize how reshared posts differ from original (not reshared) posts. In particular, we show how the content seen by study participants in the control group varies depending on whether it was original (not reshared; i.e., created by a friend, Page or Group they are connected to) or reshared. We report results for all metrics that were available in the datasets that we pre-registered.

Our results here are consistent with what we find in Figure 2 of the main text. For example, we find that a large majority of reshared posts are reshared by users; that reshares are also more likely to feature content by untrustworthy sources; and that reshares are more likely to be like-minded but also cross-cutting. These results help to explain why our treatment decreased exposure to posts by friends, from untrustworthy sources, and from like-minded and cross-cutting sources. Importantly, this last result is suggestive of one potential path by which we could have hypothesized that exposure to reshared posts is polarizing: reshares are less likely to feature content from sources with moderate or ideologically mixed audiences.

Table S47: Proportion of original and reshared posts seen by control group that are classified into each category

	Non-reshared	Reshared
Friend posts	47.07%	81.65%
Page posts	27.77%	13.21%
Group posts	24.86%	5.01%
Misinformation	0.04%	0.01%
Untrustworthy sources	2.27%	3.68%
Like-minded sources	51.43%	59.14%
Cross-cutting sources	19.70%	23.06%

S3.2 Exploration of Mechanisms

This section describes a series of additional exploratory analyses we conducted in order to contextualize the main results we describe in the paper, as well as to explore potential mechanisms that may explain them. In particular, we seek to further characterize the impact of the treatment on a series of new outcomes that could function as mechanism to explain why we observe that participants in the treatment group were less likely to correctly remember events that happened (decreased news knowledge) and more likely to believe in false claims (decreased knowledge and information) – with all these results being statistically significant at $p < 0.05$, but not after adjusting for multiple comparisons. We work under the assumption that outcomes that are not affected in a meaningful way by the treatment are unlikely to play a role in driving our results.

We found the following:

- We find that the No Reshares treatment did not increase exposure to Groups where misinformation is repeatedly shared (defined here as Untrustworthy Groups).
 - In the main text of the paper, we report that one of the largest effects of our treatment was increased exposure to content shared on Groups – from 24% of all content seen by the control group to 32% in the No Reshares treatment group. We explored whether this increase was largely driven by higher exposure to Groups where misinformation is repeatedly shared (see SM [S7.2](#) for additional details on definition.)
 - In relative terms, the treatment led to a small increase in exposure to content from such Untrustworthy Groups, which represented 0.27% of all content seen in News Feed in the treatment group, compared to 0.24%, but this difference was not statistically significant ($p = 0.11$). However, since the treatment group reduced their time spent on Facebook, the absolute number of posts shared in Untrustworthy Groups that No Reshares respondents saw during our study period actually decreased by 2.5% (from 66.0 in the control group to 64.3 in the treatment group), although this difference is not statistically significant either ($p = 0.71$).
 - The treatment did not increase the average number of untrustworthy Groups that respondents are members of: as of the end of the study period, 21.5% of respondents in the control group and 21.7% of respondents in the treatment group were members of at least one Untrustworthy group ($p = 0.83$); the average number of Untrustworthy Groups that respondents in the control group were members of was 0.60 compared to 0.64 in the treatment group ($p = 0.48$).
- We find that the No Reshares treatment did not increase exposure to like-minded sources.
 - As reported in the main text, we find that the treatment decreased exposure to *both* cross-cutting and like-minded sources. The effect was somewhat larger for like-minded than cross-cutting sources, so considering only these two types the balance tilted towards increasing cross-cutting exposure. However, the largest effect was an increase in exposure to content from moderate sources. This pattern leads to discount the possibility that our results are driven by increased exposure to like-minded sources, which we hypothesized could have reduced byproduct learning about the election.
- We find that the No Reshares treatment did not systematically affect exposure to Facebook products aimed at increasing general knowledge
 - If respondents in the No Reshares treatment group spent less time on Facebook and saw less political content, it is possible that their observed decrease in knowledge may be driven by less frequent exposure to Facebook products aimed at increasing election-related knowledge.

- However, we do not find any significant differences on exposure and engagement with the Voting Information Center (VIC): on average, respondents in the treatment group saw 14.5 posts in the VIC and clicked on 0.13 of them; compared to 14.9 and 0.13 in the control group ($p = 0.31$ and $p = 0.49$, respectively).
- We find that the No Reshares treatment greatly decreased exposure to mainstream news sources.
 - Political knowledge may have decreased if participants were less exposed to news stories about politics and the election. In the main text we report that the treatment decreased exposure to political news by nearly 60%. Here, we focus specifically on exposure to mainstream news sources, which are more likely to share reliable information about political events.
 - The list of mainstream news sources we study contains 20 outlets selected by (33) based on a report from the Pew Research Center on the news sources with the most US online traffic. The full list is: Bloomberg, CBS News, CNN, Economist, Fortune, FoxNews, ABC News, Huffington Post, MSNBC, NBC News, Newsweek, NPR, New York Times, PBS, Politico, Salon, The Guardian, USA Today, Washington Post, and Wall Street Journal. We consider both exposure to posts by these outlets' Pages (either via original content because the respondent follows these Pages or indirectly via reshares) as well as any post that contains links to the domains of these 20 outlets.
 - We find that exposure to mainstream news represents 1.95% of all News Feed views in the control group, but only 0.74% in the treatment group (a 61% drop). This difference is statistically significant ($p < 0.01$).

Overall, as we report in the main text of the paper, our interpretation of these results is that decreased exposure to mainstream news sources may have contributed to the observed reduction in respondents' level of political knowledge. However, since our experiment was not designed to test the mechanism driving our results, we argue that this explanation should be read as exploratory.

S3.3 Comparison of Sample and MAP users

We show on-platform and survey-based descriptive statistics of respondents who participated in the experiment (treatment and control) with Monthly Active Persons (MAP), who are all U.S. Facebook monthly active users 18 years of age or older eligible to receive general surveys on the platform, which represent a random set of users from the overall Facebook population. The tables also include data for those who consented to off-platform tracking of browsing activity (i.e., passive tracking).

Table S48: Activity on Facebook among full respondent sample and respondent sample consenting to passive tracking (unweighted) compared to US monthly active users

Metric	Sample	p2.5	median	p97.5	mean	SD	N

S4 HTE Estimation Details

In our pre-analysis plan, we pre-registered three primary moderators to assess heterogeneous treatment effects: (1) party identification measured on a three-point scale (PID_W1; PIDLEAN_W1); (2) a digital literacy index composed of eight items with respondents separated into terciles (DIGLITERACY_TERMA_W2; DIGLITERACY_TERMB_W2; DIGLITERACY_TERMC_W2; DIGLITERACY_TERMD_W2; DIGLITERACY_TERME_W2; DIGLITERACY_TERMF_W2; DIGLITERACY_TERMG_W2; DIGLITERACY_TERMH_W2); and (3) a three-point measure of political interest (originally based on a five-point scale with the bottom three response categories collapsed into one) (POLINT_W2). We also committed to assess heterogeneous treatment effects for a set of secondary moderators: age (AGE_V2), gender (GENDER), and race bifurcated by non-Hispanic whites / others (RACETHNICITY).

We use the DR-Learner (28, 34, 35) to estimate effect heterogeneity across moderators specified in each individual pre-analysis plan using the R package `tidyhte` (36). The DR-Learner is a nonparametric two-stage regression procedure that has been proven to be statistically optimal under weak conditions (28) — and under essentially no conditions in an experiment. It reduces to the well-known semiparametric efficient augmented inverse-probability-weighted (AIPW) estimator (37–41) in the case of discrete moderators.

In summary, the DR-Learner first constructs a doubly robust pseudo-outcome (28, 42), and then regresses this pseudo-outcome on moderators of interest; cross-fit sample splitting is used to prevent overfitting. There are three main pre-specification choices: how to estimate the pseudo-outcome, how to estimate the second-stage regression of the pseudo-outcome, and how to do sample splitting. The general approach is described in (28); the definition of the pseudo-outcome is:

$$\hat{\varphi}(Z) = \frac{A - \hat{\pi}(X)}{\hat{\pi}(X)\{1 - \hat{\pi}(X)\}} \{Y - \hat{\mu}_A(X)\} + \hat{\mu}_1(X) - \hat{\mu}_0(X)$$

where X denotes covariates, A a binary treatment, Y the outcome of interest, $\hat{\pi}(x)$ an estimate of the propensity score $P(A = 1 \mid X = x)$, and $\hat{\mu}_a(x)$ a regression prediction of $\mathbb{E}\{Y \mid X = x, A = a\}$. The pseudo-outcome mimics the difference in counterfactual outcomes ($Y^1 - Y^0$) that would be observed under treatment versus control in the sense that the true pseudo-outcome $\psi(Z)$ has conditional expectation exactly equal to the CATE: $\tau(x) = \mu_1(x) - \mu_0(x)$.

The doubly robust pseudo-outcome in the DR-Learner is built from two ingredients: propensity scores and regression predictions. In this experiment the propensity scores are simply the known randomization probabilities. The regression predictions are built using the `SuperLearner` package in R, via a cross-validated ensemble of learners including linear regression, lasso with two-way interactions, random forests, boosting, and GAM.

Second-stage DR-learner: “Effect models” This second-stage model will sometimes be referred to in this document as an “effect” model, in contrast to the “outcome models” discussed above. There are two different scenarios we consider:

1. Within-group averages are used when the moderators are discrete and low-dimensional (five or fewer levels); this is equivalent to the classic AIPW estimator (37–41).
2. For single continuous moderators we use local polynomial regression (43, 44).

We use 12-fold cross-validation for tuning parameter selection, both for regression predictions and second-stage pseudo-outcome regression, with 12-fold cross-fitting to separate building of regression predictions from the second-stage regression and second-stage model selection. This ensures efficient use of the data, as each observation will separately contribute to regressions in both first and second stages.

Reporting of HTE results We report Marginal Moderation Effects (MCATEs):

- These correspond to the standard notion of a CATE (sometimes referred to as the Group Average Treatment Effect). In other words, it provides the average effect for all users with a particular value of a covariate V included in X .
- If two potential moderators are strongly correlated, both will appear to have a strong marginal moderation effect.

$$\text{MCATE}(v) = \hat{\mathbb{E}}\{\hat{\varphi}(Z) \mid V = v\}$$

where $\hat{\varphi}$ indicates the estimated pseudo-outcome, and $\hat{\mathbb{E}}$ indicates predictions from the effect model (the specific model is determined by the procedure in the previous section).

Results on pre-specified moderators: For all MCATEs, the appropriate effect model is chosen based on whether the hypothesis of interest is low-cardinality (model 1) or not (model 2). Plots are generated for slices along the effect model in one dimension.

Hypothesis testing of moderation

- For hypothesis tests against the null hypothesis that a variable is not a moderator, we use the variable importance (defined above).
- Multiple comparisons corrections are used according to the procedure detailed in the “Estimation of treatment effects” subsection (i.e., with separate FDR control for primary and secondary moderators).

Model diagnostics

- Propensity scores are known, so no diagnostics are necessary.
- Outcome models:
 - We examine common error metrics such as cross-validated mean squared-error (as primary error-metric) along with other proper scoring rules.
 - We show the ensembling weights (and standard errors) for the SuperLearner model for each response surface.
 - We evaluate plots of Regression ROC curves (45) to demonstrate the performance of the regression more broadly.
 - The full set of diagnostics are not reported here due to space considerations, but will be released as part of the replication materials.
- Effect models:
 - Cross-validated mean squared-error for each model considered.
 - Regression ROC curves.
 - For each effect model (3), we plot the average predicted effects from the effect model against the difference-in-means effect, (a) binned by the predicted effects from the effect model and (b) binned by the pre-specified low-dimensional moderators.

S5 Factor Loadings of Survey Scales

This section reports factor loadings of survey scales used to construct various indices used in the analyses. See Section S14 for question wordings associated with each question item code.

S6 Coding of On-Platform Behavior

We analyze the following metrics based on on-platform behavior:

1. Exposure-based metrics

- These metrics aggregate counts of views on content on Facebook’s Feed. A view on a post is counted whenever the post renders in the visible portion of their Web browser or mobile device for more than 250 milliseconds (i.e., a “validated viewport view” or VPV) on Facebook.
- Unless otherwise noted, other feeds on Facebook (e.g., Groups Tab or News Tab) are excluded from all exposure metrics, since our intervention only manipulated the main platform feeds.

2. Engagement-based metrics

- We consider the following types of engagement: clicks, likes, reactions, comments, and reshares for Facebook. In some analyses we bundle these metrics, depending on how visible the actions are, into *active* (comments, reshares) and *passive*, which we further disaggregate into likes and reactions, and clicks.
- Clicks are counted once per post and per day if a respondent clicked on any component of a post. This includes clicks on external URLs, clicks to “See More” and expand the text of a post, clicks on the post author’s name, click to enlarge a picture, clicks to reshare, as well as clicks to add a like, reaction, comment, or any other type of engagement with the post.
- The surfaces included in the engagement metrics are identical to those included when measuring exposure, in order to be consistent across the two types of metrics. The only exception is reshares on Facebook, which we aggregate over all surfaces because, due to logging limitations, we are not able to identify the surface on which a user was when they reshared a post.

3. Production metrics

- Our metrics of content production refer to the count of new posts created by the respondents in the study. For Facebook, this includes both original posts and reshared posts created on users’ Feed, on their Profile, or on a Group. All types of posts are considered here (text posts, url posts, image posts, photo albums, etc.).

4. Network metrics

- These metrics refer to the connections that respondents make to other users or entities on each platform. For Facebook, we measure connections to other users (i.e., friends), Pages, and Groups.

- Our metrics of network exposure are defined based on the actor that is closest to the viewer. In other words, in the case of reshared posts, the connection is defined based on the respondent's relationship to who is resharing a post and not its original content creator. For example, if the respondent sees a post created by a Page and then reshared by one of the respondent's friend, we would count it as friend content.
- Note that, in contrast to other exposure or engagement metrics, our pre-registered approach to computing variables related to respondents' networks first consists of computing averages of daily metrics, as opposed to a single average over the entire period. We made this decision due to feasibility considerations (it was challenging to count unique exposures across a long period) and with the purpose of ensuring that specific days that may see spikes in network activity do not drive the total average.

5. Time spent

- Our metric of time spent on Facebook is based on Meta's internal measures of the amount of time that each person actively engages with the app or website. This metric includes time spent on all surfaces for both platforms. We report the average daily proportional increase in time spent with respect to the average U.S. monthly active users, which is computed by computing the proportional difference between each user's time spent on a given day and the time spent of U.S. monthly active users as of that same day, and then averaging over the entire study period. A value of -1 would indicate 100% decrease in time spent with respect to monthly active users; a value of 0 indicates the same amount of time; and a value of e.g. 0.50 would indicate 50% more time spent each day on average.
- Our measures of time spent off-platform on other websites or mobile apps are based on the passive tracking data that a subset of our respondents provided (see SM Section S9). In particular, we measured total web visits (with domain-level granularity only) on desktop/laptop devices, tablets, and smartphones on Windows, Mac, and Android systems, as well as app usage (time spent on apps) on Android smartphones and tablets only.

6. Indices of on-platform engagement

- Index of social media activity, used as a moderator in the heterogeneity analyses, which is computed by applying factor analysis to a set of metrics: number of days active on the platform over the last 28 days, number of posts, number of views, number of likes, number of reactions, number of reshares, and number of comments.

7. Ideological alignment

- We use the US ideology classifier (described in Section S7) to determine ideological alignment between study participants and the sources of content (or their audience) they were exposed to or engaged with.

- We use two-class classification, categorizing respondents as *liberal* if they have a predicted ideology score less than 0.50, or as *conservative* if they have a score greater than or equal to 0.50.
- We then categorize content sources (e.g. friends, Pages, or Groups) as *liberal* if they have a predicted user or audience ideology score less than or equal to 0.40, and as *conservative* if they have a score greater than or equal to 0.60. If their score is between 0.40 and 0.60, we consider it moderate for users, based on their predicted ideology, or ideologically mixed for Pages and Groups, based on the composition of their audiences. (See more details on how user ideology and entity audience ideology are measured in Section S7.)
- For predicted liberal and conservative participants and sources (based on their audiences), content from a friend, Page or Group is then considered *like-minded* with respect to a participant whenever both the participant and source’s predicted categories match, or *cross-cutting* if they do not. Content from sources that are predicted to be neither liberal nor conservative (i.e., moderate users and entities with ideologically mixed audiences) is considered neither like-minded nor cross-cutting.
- The decision to assign all users to a *liberal* or *conservative* category is driven by our attempt to maximize coverage of our metrics that capture exposure to *like-minded* or *cross-cutting* sources. By doing so, we are able to compute these metrics for all respondents in our sample.

Depending on the analysis, we rely on metrics computed using different levels of aggregation:

- Study period: these metrics are based on computing the total count for the period that our intervention was running (2020-09-24 until 2020-12-22; intervention ended 2020-12-23 halfway through the day so metrics are aggregated until end of day on 2020-12-22). In some cases, these metrics are normalized by dividing by total views over the same period.
- Pre-treatment period: these metrics are based on computing the total count for a period of 90 days prior to treatment initiation (2020-06-26 to 2020-09-22).
- Static metrics: these metrics are reported as of treatment initiation (2020-09-23).

S7 Classification and Categorization Methods

Our analysis relies on classifiers and categorization methods to characterize either content or sources, which we describe below.

S7.1 Meta Classifiers and Categorization Methods

The following classifiers, concepts, and categorization methods were either developed at Meta or are defined under Facebook’s platform policies.

- Civic classifier
 - **Definition:** This classifier predicts whether a given post is related to *politics* (government, elections, politicians, activism, etc.) or *social issues* (major issues that affect a large group of people, such as the economy, inequality, racism, education, immigration, human rights, the environment, etc.). In this paper, we refer to any content that is classified as being either of these two categories as “political”; otherwise they are not political.
 - **Usage:** We use the classifications for Facebook posts of any type (links, photos, videos, text) that were created, seen or engaged with by US users during the US 2020 FIES. We use the classifications for both English- and Spanish-language content. (We refer to content classified as such as “political” in the main text.)
 - **Performance:**
 - * Based on a sample of approximately 10k labeled posts, the classifier has 83% precision and 82% recall on English-language Facebook content.
 - * Based on a sample of approximately 17k labeled posts, the classifier has 81% precision and 85% recall on Spanish-language Facebook content.
- Ideology classifier
 - **Definition:** This classifier predicts adult US active Facebook users’ political ideology.
 - **Methodology**
 - * The classifier is trained to predict the self-reported ideology of adult US monthly active Facebook users based on their demographics, preferred language, location, and engagement with content, Pages, and groups. It outputs a numeric score ranging from 0 (indicating a user is predicted to be liberal) to 1 (indicating a user is predicted to be conservative).
 - * The classifier has high coverage – it is able to place up to 95% of adult US monthly active Facebook users on this numerical scale. The classifier also has high week-over-week stability – on average, the weekly scores for individual users have a correlation of 0.96.
 - * To further categorize adult US monthly active Facebook users into distinct ideological groups, we discretize the continuous ideology scores as follows. Additional details on how the different categories are used in our analysis is available in SM [S6](#).

- 2-class ideology: Users whose ideology score is less than or equal to 0.5 are classified as *liberal*, else *conservative*.
- 3-class ideology: Users with a score less than or equal to 0.40 are categorized as *liberal*. Those with a score greater than or equal to 0.60 are categorized as *conservative*. The remaining users with a score between 0.40 and 0.60 are categorized as *moderate*.
- * **Entity audience ideology scores:**
 - We use the user-level ideology scores to generate similar ideology scores for Pages, Groups, and web domains. We do so by computing a measure of the ideological composition of their audience: the average predicted ideology of Facebook users engaging with these entities in the last 28 days.
 - This approach places Pages, Groups, and web domains on the same 0-1 numeric ideology scale as users. As such, we use the same thresholds for categorizing these entities into ideological groups as those specified above, with one exception: we use the term “mixed” rather than “moderate” for the middle category in 3-class ideology, as the scores reflect the ideological composition of entities’ audiences and not the ideology of the entities themselves.
-
- **Usage:**
 - * We use the ideological classifications of US monthly active Facebook users 18 years or older who were active during the US 2020 FIES.
 - * We use the audience ideology classifications for all Pages, Groups, and domains producing content that US active Facebook users saw or interacted with during the US 2020 FIES.
- **Performance:** We evaluated how well the user-level inferences performed at inferring self-reported ideology by comparing our classifications to the survey responses of approximately US 2020 FIES panelists. Precision and recall for each ideological group are as follows:
 - * 2-class classification
 - Self-reported Liberals: 85% precision and 86% recall
 - Self-reported Conservatives: 83% precision and 83% recall
 - * 3-class classification
 - Self-reported Liberals: 59% precision and 80% recall
 - Self-reported Moderates: 52% precision and 21% recall
 - Self-reported Conservatives: 56% precision and 78% recall
- We note that the reason precision is lower across all groups and recall is lowest for self-reported moderates in the three-class classification task is that the model

tends to predict self-reported moderates to actually be left- or right-leaning. This is consistent with external research finding self-reported moderates often have non-centrist ideological positions on various issues (46).

- We also evaluated how well the audience ideology measure might approximate the ideological affiliation of the entities themselves, if one exists. We compared the audience ideology scores we computed for the official Facebook Pages of US Members of Congress to a widely-used external measure of those Congress members' ideology derived from their legislative voting history, DW-NOMINATE (47), finding a 0.96 correlation (N = 409).

- News classifier

- **Definition:** This binary classifier predicts whether content is about current events, timely information, and follows journalistic standards such as citing sources and having a byline. See <https://www.facebook.com/business/help/22409977271922> for additional information.
- **Usage:** We use the classifier predictions for Facebook posts with a link or video that were created, seen or engaged with by US active users during the US 2020 FIES. We use the predictions for both English- and Spanish-language content. For our analysis, we focus specifically on *civic news domains*, which are domains whose URLs are frequently categorized as civic as defined in the “Civic classifier” section above and as news by the News classifier relative to other content on the platform. (We refer to content classified as such as “political news” in the main text.)
- **Performance:** Classification thresholds were chosen to yield 80% recall. Based on a sample of approximately 52k labeled links, precision at this threshold is 90% for US English-language News links. Based on a sample of approximately 36k labeled links, precision at this threshold is 42% for US Spanish-language News links.

- Misinformation

- **Definition and operationalization:** Misinformation refers to content that is directly rated “false” by one of Meta’s independent fact-checking partners, or posts containing text, images or videos that are matched to such content using matching algorithms. See <https://www.facebook.com/business/help/341102040382165> for a detailed description of how this rating category is defined.
- Meta’s third-party fact-checking partners are certified by the nonpartisan International Fact-Checking Network. A full list of these partners is available at <https://ifcn.codeofprinciples.poynter.org/signatories>. In the US, this list includes organizations such as Snopes, Reuters, The Washington Post, Fact Checker, FactCheck.org and PolitiFact. All fact-checks are publicly available on the websites of these organizations and can be reviewed by any external source for accuracy.

S7.2 Other Classifiers and Categorization Methods

This section describes the classifiers and categorization methods used in the US 2020 FIES that were either proposed by the academic team or adapted from published academic research. In the case of methods proposed by or co-developed with the academic team, a thorough performance evaluation by the US 2020 FIES academic and Meta researchers was not conducted due to time constraints in applying the methods to content or entities within Facebook’s and Instagram’s data retention periods. Instead, we relied on existing performance metrics when available (referenced below in regard to each classifier). In addition, when possible, the US 2020 FIES academic and Meta researchers did hand-label a small set of examples, and rough performance estimates based on these samples are included below.

- Content with slur words classifier
 - **Definition:** This classification method is adapted from (48), which identifies content containing at least one term sourced from Hatebase and the Racial Slur Database and attempts to reduce false positives introduced by the inclusion of terms with ambiguous meaning. (48)’s classification method labels content as falling within any of eight different categories (listed below), as well as a joint category (“content with slur words”) that encompasses all of them.
 - * List of categories: anti-Asian, anti-Black, anti-Immigrant, anti-Muslim, anti-Semitic, anti-Latinx, homophobic, misogynistic
 - This categorization method aims to capture content that could be perceived as hateful but need not violate Facebook’s Community Standards or may not be captured by Facebook’s existing automated systems.
 - **Methodology:** The method developed by (48) consists of a dictionary method that was augmented using machine learning methods in order to reduce the false positive rate. First, it identifies any post or comment that contains at least one slur associated with each of the eight categories described above, based on a list sourced from Hatebase and the Racial Slur Database. Second, it applies a text-based classifier trained on a random sample of tweets to attempt to reduce false positives from terms that have multiple meanings, not all of which may be considered a slur (for instance, a benign use of “sneakers” as opposed to its usage as an anti-Black slur).
 - We note two limitations of this method, both of which are common to slur-based approaches to hate speech classification. First, the classification method only detects an inherently limited set of slurs. A great deal of hateful content is more nuanced, subtle, and/or complex, making it hard to automatically classify in any instance, but especially hard to do so using the detection of slurs (49). Second, in selecting this classification method, we chose to err on the side of false positives (recall) as opposed to false negatives (precision). As a result, some of the content classified as containing one or more slur words may capture ingroup discourse and banter (e.g.,

use of the n-word among Black communities and use of “bitch” among women), neither of which the false positive filter is designed to filter out. We therefore describe it here as “content with slur words” (a deviation from our preregistration). In general, we acknowledge that a slur-based approach may miss important context and produce both false positives and false negatives (50).

- **Usage:** We apply the externally trained classification method to generate predictions for Facebook posts and comments that were created, seen or engaged with by US users during the US 2020 FIES. This classification method was applied to English-language content only.
- For posts, the classification method is applied to the text of the post, the text contained in attached images, and a transcription of any attached videos. For comments, the classification method is applied to the text of the comment only.
- For reshared posts, a post is classified as containing one or more slur words if the original post or the reshared post (including the text that was added to the reshared post) was classified as containing one or more slur words.
- **Performance:** (48) estimate this classification method has 94% accuracy, 95% precision, and 90% recall for content with a slur. In our data, over 90% of content predicted to contain a slur word using this method falls under the “misogynistic” subcategory.

- Incivility classifier

- **Definition:** The classifier aims to capture uncivil content, defined as: “Features of discussion that convey an unnecessarily disrespectful tone toward the discussion forum’s participants or its topics, which is including but not limited to: (1) Name-calling, mean-spirited or disparaging words directed at a person or group of people. (2) Aspersions, mean-spirited or disparaging words directed at an idea, plan, policy, or behavior. (3) Vulgarity, using profanity or language that would not be considered proper in professional discourse. (4) Pejorative for speech, disparaging remark about the way in which a person communicates.” This approach follows the definitions from (51). Note that uncivil language as defined here may not necessarily be threatening or harmful and could be used to emphasize opinions, see for example (52).
- **Methodology:** The classifier is a regularized logistic regression, using unigrams as features, trained on two datasets: (1) A random sample of 5,000 Reddit comments, collected by (53), annotated by three undergraduate students (inter-coder agreement = 91%); (2) A random sample of 4,000 tweets, annotated by crowd workers (inter-coder agreement > 80%), along with a synthetic set of 16,000 tweets labeled by the Google Perspective API, collected by (54). The training dataset was complemented with 5 million labels generated using DistillBERT to improve its performance. We

applied the externally trained classifier to the Facebook content categories described above, using text-based features and OCR'd text from images. For reshared posts, a post is classified as uncivil if the original post was classified uncivil or if the reshared post was classified as uncivil.

- **Usage:** We use the externally trained classifier to generate predictions for Facebook posts that were created, seen or engaged with by US users during the US 2020 FIES. This classifier was applied to English-language content only.
- **Performance:**
 - * Predictions from this model were estimated by (53) to have 85% precision and 72% recall on the Reddit dataset (computed on a test set not used for training) and 89% precision and 70% recall on the Twitter dataset.
 - * Based on human annotations conducted by the Meta research team and validated by a subset of the academic researchers on the US 2020 ERP comprising a random sample of 100 Facebook public posts and 100 Facebook public comments, we estimate that the classifiers have: (a) Facebook comments: 86% precision; (b) Facebook posts: 83% precision.
 - * Based on a set of synthetic examples available in (55) from African-American Vernacular English, compared to their Modern Standard English variation, we found that the classifier yields similar predictions, which we take as evidence of adequate calibration.

- **Untrustworthy Sources**

- **Definition:** For purposes of this research project, we define untrustworthy sources based on the number of misinformation “strikes” they have accrued under Meta’s Misinformation Repeat Offender Policy, where a strike may be counted when an entity produces content that is rated false or altered by one of Meta’s independent fact-checking partners. On Facebook, we define Untrustworthy sources to encompass Pages, Groups, and domains that have accrued two or more misinformation strikes since the MRO program began in 2018 (i.e. ‘lifetime’ strikes).
- **Operationalization:** Due to data retention limitations, we can only estimate the number of strikes accrued by an entity using the number of pieces of content that received a false or altered rating by one of Meta’s fact-checking partners. Pages or Groups that have posted such content at least twice, or domains with two or more URLs rated as “false” by a third-party fact checker are considered untrustworthy sources. In practice, the actual number of strikes an entity accrues does not necessarily equal the number of individual pieces of content that are fact-checked as false or altered due to the complexities of Facebook’s Misinformation Repeat Offenders policy. This operationalization of how we determine whether a source is considered untrustworthy in this dataset is therefore more expansive than what was originally

pre-registered for this project and will necessarily overestimate participant exposure to untrustworthy sources. We exclude from this list of domains other social media platforms, hosting sites, and URL shorteners, even if they may host URLs that have been fact-checked as false.

S8 Experimental Study Design

Information in this section is relevant, but not specific to the experiment containing the No Reshares condition. This experiment involving reshared content is one of multiple experiments of the Meta-Academic collaboration, which are referred to as “on-platform interventions” or “on-platform experiments,” taking place on Facebook and Instagram. We describe sampling, power calculation, participant recruitment, randomization, and weighting for all on-platform interventions rather than only the No Reshares intervention because the sample was recruited for on-platform interventions. That is to say, until consenting participants were assigned to the No Reshares condition, they were all part of the on-platform interventions sample.

S8.1 Sampling

The sampling approach was designed to achieve specific sample targets across different stages of the study. The study consisted of six survey waves (the first five of which are relevant for this paper).

The sample targets for each type of study are provided in Table S50. These targets were chosen to achieve desired minimum detectable effect sizes (MDEs) across different subgroups among the set of respondents participating in the wave 1 (recruitment) and wave 2 (baseline) surveys as well as at least one of waves 4 or 5 of the study, which we refer to as *three-wave completes*.^{S3} We worked backward from our target MDEs in waves 4 and 5 to determine the number of respondents we would need at the recruitment stage (initial 3-wave). The three-wave completes target sample for on-platform interventions was adjusted after observing the level of attrition between the wave 1 and wave 2. In response, and prior to treatment randomization, the academic researchers in the study decided to cut two studies from the set of planned platform interventions on Facebook, which would have varied content in the Voting Information Center and removed Pages and Groups content from Facebook Feeds. The revised targets can be found in the last column of Table S50 (final 3-wave).

The table also includes sample size targets for users who were interested in taking the surveys associated with the study but not in having their experiences change on Facebook (“surveys only”). This sample was included to get a sense of the biases associated with selection into the study. There were no specific demographic targets for this sample as there were for other samples. The share of respondents in the surveys-only sample coming from each of the individual study samples was proportional to the target sample size for each study.

^{S3}See Power Calculations in Section S8.3 for details on how MDEs were determined across studies.

Table S50: Target sample size across platforms and studies

Apps	Study sample	Wave 1	<i>Sample targets</i>	
			Initial 3-wave	Final 3-wave
FB	Platform interventions except un-trustworthy (7, then 5 interventions)	119,000	71,118	54,740
FB	Untrustworthy platform interventions	18,000	10,800	10,800
FB	Deactivation	43,000	21,944	21,944
FB	Surveys only	8,333	5,000	5,000

The three-wave sample targets were revised after observing the wave 1 and wave 2 survey completions and adjusting the proposed number of treatment arms prior to randomizing participants into condition.

Sampling Frames and Strata Definitions: The sampling frames included all Facebook monthly active U.S.-based users 18 years of age or older eligible to receive general surveys on a given platform (these represent a random set of users from the overall Facebook populations) as of August 17, 2020. Participants were asked to confirm they were over 18 years of age and lived in the United States as part of the recruitment process. The Facebook sampling frame was trimmed by removing predicted fake accounts, employees, and advertisers.

To guarantee sufficient representation of specific users in the sample, the sampling frame was stratified along the following covariates: number of days a user was active on a given platform (the number of days a user logged in to Facebook in the 30 days on or before August 17, 2020, classified into three categories: 1-14 days, 15-29 days, and 30 days), a user's predicted census region (East, Midwest, South, West),^{S4} whether the user is predicted to live in a battleground state,^{S5} a user's predicted ideology (liberal, moderate, or conservative),^{S6} and the census ethnic/racial composition in the zip code in which a user is predicted to live (percent of Hispanic residents and Black residents).^{S7} The stratification of the sampling frame for these

^{S4}The classification of states across each of the census regions is available [here](#).

^{S5}Following the two most recent [Electoral College Ratings](#) by the Cook Political Report prior to August, we defined as battleground states those whose complete electoral geography was considered in the "Toss Up", "Lean Democrat", or "Lean Republican" in at least one of the reports. "Toss Up" states included: Arizona, Georgia, Maine, North Carolina; "Lean Democrat" or "Lean Republican" states included: Florida, Michigan, Minnesota, New Hampshire, Pennsylvania, Wisconsin, Iowa, Ohio, and Texas. Nebraska was excluded because only one of three congressional districts was identified as a battleground district.

^{S6}See the Classifiers appendix in Section [S7](#) for additional details on how ideology is predicted. Liberal users have predicted ideology score below 0.35, conservative users have a predicted ideology score above 0.65; moderates have a predicted ideology score between 0.35 and 0.65.

^{S7}Some fields had missing values (e.g., predicted ideology, state, and zip code). Individual values were imputed probabilistically using the distribution of demographics in the population. In general, the percent of missing values

Table S51: Target Sample Demographic Distributions Across Studies

App	Demographic	Study Sample	Target Distribution
Facebook	Number of Days User Logged in to App	All Studies	Less than 15 days (4%); between 15 and 29 days (24%) and; 30 days (72%)
Facebook	Minority Users (Black or Hispanic)	Platform Interventions (incl. No Reshares)	Facebook: 56% in battleground states and 58% in non-battlegrounds states.
Facebook	Users in Battleground States	Platform Interventions (incl. No Reshares)	Facebook: 40%
Facebook	Predicted Ideology	Platform Interventions (incl. No Reshares)	Liberal, Moderate, Conservative. No initial target.

samples generated 621 population cells.

Sampling Probabilities and Target Distributions: Having defined the sampling frames, sampling probabilities were computed to achieve specific sample distributions for the set of demographics encoded in the stratification step across each of the samples of interest. The sampling probabilities took into account (a) differential non-response across different demographics^{S8} and (b) the desired sample size across the different studies.

The Wave 1 target sample size took into consideration a total attrition rate of 40% between Wave 1 and the combination of Wave 2 and at least one of Waves 4 or 5 (three-wave completes) of the study, while ensuring our ability to detect an MDE of 1.5 percentage points on turnout and vote choice. The specific distributions we aimed for these samples are included in Table S51.

As shown in Table S51, the target distribution for Facebook users included 4% of those logging on for fewer than 15 days, 24% between 15 and 29 days, and 72% for 30 of the past 30 days. In battleground states, the target sample of minority (Black or Hispanic) users was 56% on both platforms. In non-battleground states, the target sample was 58% minority users on Facebook. The remaining rows show the targets based on geography and predicted ideology.

In meeting these targets, it is important to take into account three considerations:

1. All else equal, the probability of a user being invited to participate in the study in a given strata is proportional to its size in the sampling frame.

for a given demographic was quite small, never exceeding more than a few percentage points of the population.

^{S8}Responses to Facebook surveys with a similar design were used to model differential response rates.

2. There was no initial target distribution for ideology. We incorporated this dimension to the stratification in the second week of recruitment, after seeing that self-reported white liberal users were more likely to consent to participate in the study. We did so by over-sampling, based on their predicted ideology, moderate and conservative users. No specific targets were identified, but the proportion of users who self-identified as Democrats was reduced.
3. Meta informed the academics that it had limited race/ethnicity data coverage for its U.S. users and it could not be used to inform large scale probability sampling. Instead the probability that a given survey respondent identifies with a given ethnic/racial category was derived based on the ethnic/racial distribution of a user's predicted zip code. The approach to sample minority users had mixed results in the early stages of the recruitment period, and in light of observed imbalances in ideology, ideology targets were prioritized.

Implementation of Sampling Scheme: After defining the sampling probabilities, the sampling scheme was executed across Facebook. In the implementation of the sampling scheme two additional steps were taken:

1. The sampling probabilities were adjusted when the size of a given stratum was exhausted. The adjustment to the sampling probabilities for non-exhausted cells across the sampling frame was done in proportion to their size.
2. Sampling was executed sequentially to avoid users being invited to more than one intervention within a given app. This left a small probability that users of Facebook and Instagram could have been invited to participate in a similar or different experience across the two apps.

Sampling for Race and Ethnicity: The project aimed for specific sample proportions of Black and Hispanic users in the sample. Meta informed the academic team that Facebook and Instagram do not have data on the race/ethnicity of U.S. users that could have informed our sampling decisions. Therefore, the probability a given user identified with one of the categories of interest within a given strata of the sampling frame was modeled. The focus was on achieving targets for the White and Other ethnic categories, which allowed us to obtain the desired distribution for minorities as the residual categories, based on people's predicted zip codes. The implementation of this approach involved the following steps:

1. Let i represent one of the stratum of the S strata in the sampling frame of a given app. Let X_i represent the vector of covariates defining the characteristics of strata i . The vector X_i has the following components: number of days users were active on the platform in the last 30 days, census region, battleground state, predicted ideology, zip code percent Black, zip code percent Hispanic.

2. Within a given X_i we compute the probability that a user belongs to one of three different categories: Black, Hispanic, and White or Other. The following steps were followed:
 - (a) We use the quartiles of percent Black and Hispanic in a given zip code. For these two categories we have four potential values 0–25%, 25–50%, 50–75%, 75%+.
 - (b) The lower and upper bounds of the residual category are backed out of the combination of these quartiles. For example, in a zip code with 0–25% Hispanic and 0–25% Black, we know that the White or Other population represents at least 50% or at most 100%.
 - (c) Based on this information, the probability of a user's race/ethnicity was derived using the midpoints of each of the quartiles across all ethnic categories. In the example introduced in the previous bullet, the probabilities were as follows: $\Pr(\text{Hispanic}) = \Pr(\text{Black}) = 0.125$ and $\Pr(\text{White or Other}) = 0.75$.
 - (d) The only exception is when the bounds for White or Other are 0–25%. In this situation, $\Pr(\text{White or Other}) = 0.125$ and $\Pr(\text{Hispanic}) = \text{Hispanic midpoint} * (1 - \Pr(\text{White or Other}))$ and $\Pr(\text{Black}) = \text{Black midpoint} * (1 - \Pr(\text{White or Other}))$. This solution applies to cases when the percent Hispanic is 0–25% and the percent Black is 75–100%. Otherwise, if we simply used midpoints to assign probabilities would yield $\Pr(\text{Hispanic}) = 0.125$, $\Pr(\text{Black}) = 0.875$, and $\Pr(\text{White or Other}) = 0.125$, which would sum to more than one.
3. For a given attrition and click-through rate we back out the number of Wave 1 respondents in the White or Other category needed to achieve the target for this group in the three-wave complete sample. In particular, the number of Wave 1 respondents in the White and Other category is:

$$n_o|stratum_i = pr(\text{White or Other}|stratum = i) * pr(s = 1|stratum = i) * N_i$$

where $pr(s = 1|stratum = i)$ represents the probability a user in stratum i is invited to participate in the study and N_i denotes stratum i 's population size.

Solving for the sampling probability in stratum i yields:

$$pr(s = 1|stratum = i) = n_o|stratum_i / (pr(\text{White or Other}|stratum = i) * N_i)$$

4. Note that the $pr(s = 1|stratum = i)$ derived in the previous step implies that we have a total number of invitations of Black and Hispanic users. These are given by:

$$n_{Black}|stratum_i = pr(\text{Black}|stratum = i) * pr(s = 1|stratum = i) * N_i$$

$$n_{Hispanic}|stratum_i = pr(\text{Hispanic}|stratum = i) * pr(s = 1|stratum = i) * N_{strata}$$

Figure S25: Image shown to recruit participants on FB or IG

From these quantities we can back out the implied numbers of respondents in the Wave 1 and 3-Wave sample in a given stratum.

5. We repeated steps 1–4 to obtain across all strata S of the sampling frame of a given app to try to obtain the desired targets. However, as noted above, for Facebook we decided to prioritize over-sampling users on predicted ideology because (a) our initial approach exhibited mixed results in terms of meeting the specified minority targets, and because (b) the early recruitment numbers showed a skew towards Democrats. To correct the partisanship skew, we simply repeated steps 1–4 across each of three predicted ideology strata (L, M, and C) with a higher proportion of survey invitations allocated to the M and C strata.

S8.2 Participant Recruitment and Consent

At the top of their Facebook feed, randomly selected participants saw a recruitment message asking them if they would like to share their opinion as shown in Figure S25. Those clicking “Start Survey” were directed to a consent form.

Participants gave their consent to participate in the on-platform experiments using an IRB-approved consent form, as follows:

Do You Want to Participate in a Research Study About the US Election in November?

Your participation in this research will help researchers at New York University, The University of Texas at Austin, and other academic institutions, as well as Facebook, understand more about how people’s experience with Facebook and Instagram affects their opinions and behaviors on elections.

How it Works

Over the next four months, you’ll be asked to fill out a short survey each month. This monthly survey will take about 15 minutes, for a total of 60 minutes over four months. Our partner, NORC at the University of Chicago, will administer this research.

During this time, your [Facebook/Instagram] experience may be different than what you're used to. For example, you might:

- See more or fewer ads in specific categories such as retail, entertainment, or politics
- See more or fewer posts in [News Feed / your feed] related to specific topics
- See more content from some [friends/connections] and less content from other [friends/connections]
- See more or less content about voting and elections

You'll be paid at least \$30 for participating in this study and completing all four surveys, including \$5 for each of the first two surveys and \$10 for each of the final two surveys.

- You will receive your reward as an electronic gift card, delivered within 1 day of completing each survey
- You can only take each survey once
- If you do not complete the first survey, you will be removed from this study

If you choose to participate in this study, your survey responses will be linked with your Facebook and Instagram activity data from the 2020 calendar year.

Benefits, Alternatives, and Risks

There are no benefits to participating in this research, nor are there risks greater than those encountered in everyday life, including risks related to the loss of confidentiality. You can learn more about how we're keeping your information safe in the Data Collection and Your Privacy section below. You can choose not to participate in this study.

Data Collection and Your Privacy If You Choose to Participate in the Study

- NORC will join your survey responses to publicly available third-party data like if you've voted or made a political contribution, if this data is available
- Facebook will combine this data with your activity on Facebook and Instagram from the 2020 calendar year, collectively called Combined Data
- This Combined Data will only be used for research purposes and will not be used to show you ads
- This Combined Data will be shared with our academic partners and, if legally required, with the Institutional Review Board (IRB) that reviewed this study
- All access to this Combined Data will be monitored and logged

- Once this study is over, de-identified data (i.e. data where identifiers such as your name and other information that could reasonably be linked to you are removed) will be stored and shared for future research on elections, to validate the findings of this study, or if required by law for an IRB inquiry

You can decide to stop participating in this study at any time, for any reason, and without consequences. You may withdraw by visiting the study website hosted by our survey administrator, NORC at the University of Chicago, at 2020erp.norc.org

If you have any questions related to this research, you can email NORC at erpStudy@norc.org, or call toll-free at (866) 270-2602 between 9:00 AM - 10:00 PM ET.

If you are a research participant and have questions about your rights, or have concerns or complaints about this research, you can email the NORC Institutional Review Board (IRB) at surveyhelp@norc.org or call (866) 856 - 6672 between 9:00 AM and 10:00 PM ET. Please note that by contacting or providing information to NORC IRB, NORC IRB may obtain information about you, including any personal information that you share. Even though NORC IRB is affiliated with Facebook as this research study's IRB, Facebook's Data Policy does not apply to any information about you shared with NORC IRB when you initiate contact.

If you join this study, you affirm that you are at least 18 years of age and live in the United States. Once you join this study, you'll be sent off [Facebook/Instagram] to a site hosted by our study administrator, NORC, to complete a 5-minute enrollment form.

S8.3 Power Calculations

We designed our sampling approach with the goal of recruiting the minimum number of respondents required to detect meaningful effect sizes. Our target minimum detectable effects (MDE) were:

- MDE=1.5 percentage points change in vote choice for the full sample.
- MDE=2.5 percentage points change in vote choice among respondents in battleground states, oversampling respondents from these states.
- MDE=2.5 percentage points change in vote choice for African-American and Hispanic respondents, with oversampling.
- Our calculations assumed a design effect of 1.3. In order to incorporate a user's frequency of app use as an oversample category, we relaxed the assumption to 2.0. The actual design effect differed based on the actual sample composition and weighting strategy.
- The size of the control and treatment groups was chosen based on what maximized power assuming a fixed budget.

Sample size calculation assumptions: For Platform Intervention experiments, which included the No Reshares intervention:

- An independent-arm study was used, as opposed to a factorial design, due to power considerations. Since we anticipated we would observe large interaction effects across treatment arms, based on the analysis in (56), we expected that a factorial design would not increase the power of our analysis, while adding unnecessary complexity to the study.
- Following (57), we assumed that all treatment groups would be equal in size, and the control group would be $\text{SQRT}(t)$ times larger than the number of treatment groups, where t = number of treatments; i.e. initially $t=8$ for Facebook.
- We focused on two-party vote choice, as the key outcome variable for sample size analysis, and we assumed it had mean 50% and standard deviation 0.5.
- We assumed that controlling for baseline candidate preferences reduce standard errors by 45%, on the basis of (58) data. Thus, the residual standard deviation is 0.275.
- We required 80% power and $\alpha=0.05$ in a two-sided test.

Estimated Minimum Detectable Effects (Targets):

- Based on these assumptions, we initially estimated that we would require:
 - 81,918 respondents (three-wave completes) on Facebook, 26% (21,398) in the control group and 74% (60,520) in the treatment groups (7,565 per arm)
- These target sizes include both the On-platform treatments and the Untrustworthy treatment. Users in this second treatment were selected using a different sampling strategy. For that reason, respondents in that treatment arm for each platform were reassigned, as well as the proportional part of the control group, to a separate sample with target size 10,800 for each platform.
- Due to the observed attrition between wave 1 and wave 2, the number of treatment arms for our On-platform interventions were reduced from 7 to 5 for Facebook respondents.^{S9}
 - The updated probabilities of assignment to control and treatment groups were computed using the optimal allocation rule described above, with the control group being $\text{SQRT}(t)$ times the optimal treatment arm size.
 - In this new scenario, we estimated a target sample size (three-wave completes) for the On-platform Interventions (excluding the Untrustworthy treatment) of 54,740 respondents on Facebook.^{S10}

^{S9}These calculations exclude the Untrustworthy treatment, which was considered a separate sample.

^{S10}The new target sample sizes were computed as: $\text{SQRT}(t) \times N$ target 3-wave completes + $t \times N$ target 3-wave completes

Table S52: Definition of Blocks for Randomization and Treatment Assignment Probabilities on Facebook

App	Study Sample	Covariates Used to Define Blocks	Treatment Assignment Probabilities (Within Block)
Facebook	On-Platform (incl. No Reshares)	Battleground state, Friend count, Self-reported party ID, race (36 blocks)	Facebook: Pr(Control) = 0.3090 Pr(Treatment= i) = 0.1382 for i = 1,...,5.

- This sample size would allow for the detection of MDE = 1.5 on self-reported turnout for the entire sample (assuming that the residual standard deviation is 0.335) on Facebook. Note that the actual MDEs are different based on the consent rates, attrition, and covariate adjustment.

S8.4 Randomization

We adopted block randomization to minimize variance of treatment effect estimates and to ensure in-sample balance in a set of covariates that may be important determinants of the outcomes of interest.

To implement the block randomization approach, we first refined the set of study participants to include only those who completed the Wave 2 survey. This approach was adopted to minimize attrition between the baseline and the rest of the surveys in the study.

A combination of survey-based pre-treatment outcomes and Facebook data were used to define the blocks in the sample of interest. The proportions of the sample assigned to treatment and control groups were chosen as described in Section S8.3. The set of metrics used for blocked randomization and the treatment assignment probabilities in each of the samples can be found in Table S52.

The coding criteria used to create the blocks for treatment assignment are shown in Table S53. Note that these criteria were not used in all studies (see Table S52).

S8.5 Weighting

Survey weights were created to generalize treatment effects to the best estimate of adult monthly active users (all U.S. Facebook monthly active users 18 years of age or older eligible to receive general surveys on a given platform, which represent a random set of users from the overall Facebook population, as of August 17, 2020) in the Facebook population. The general approach to creating the weights was to reduce bias while maintaining a low design effect.

Table S53: Coding Criteria to Create the Strata for Block Randomization

Variable Name	Number of Potential Values	Values
Battleground State	2	Yes, No
Following/Friend Count	3	Observed terciles in the sample
Self-reported party ID	3	Democrat (with lean Democrats), Independent, Republican (with lean Republicans) (wave 1 survey response)
Race	2	White, Non-White (wave 1 survey response)

Inverse Propensity Scores Weights (IPSW) were built using LASSO regression with Facebook log data. Covariates used for block randomization and variables presumed to predict treatment heterogeneity were prioritized. For the platform interventions, the weights calibrate to the full population of Facebook users.

When the variable was used as part of block randomization, the terciles were based on the intervention sample. If the variable was not used as part of the block randomization, then we used the population and sample to define the terciles.

For Facebook, weights were built using:

- Predicted ideology (divided into liberal, moderate, and conservative using the ideology classifier described in SM Section S7 with cut points of 0.35 and 0.65).
- Friend count, divided based on terciles
- Political pages followed, divided by tercile
- The number of days a user logged on to their account in the 30 days prior to August 17, 2020, divided into 29 or less vs. 30.

If the variable was used in the block randomization step see Table S52, the terciles were based on the intervention sample. If the variable was not used in the block randomization step, the sample is combined with the population to define the terciles of the variable in question.

Raking was used to create the set of final weights that calibrate to population estimates of race (white vs. non-white), party ID (Democrat, Independent, or Republican, including leaners

as partisans), and education (less than a college degree vs. a college degree or more). The specific targets are based on the Wave 2 Amerispeak panel weights for those who reported having a Facebook (FBACCT_ACTIVE_ONE) account. More information about the Amerispeak panel is available upon request.

The final step was to trim the weights. Following the [Cooperative Election Study](#), which trims weights above a particular threshold and the [Pew Research Center](#), which has trimmed weights at the 1st and 99th percentiles, the top 1% of the survey weights were trimmed.

Design weights were not included in the computation of the survey weights as the weights increase the design effect significantly without appreciably decreasing the bias.

Because many of our outcomes rely on items from specific waves, we produced wave-specific weights. These wave-specific survey weights calibrate the sample who completed each wave to the Facebook population, as described above, in order to deal with survey unit non-response and sample stratification. For outcomes that rely on survey items across multiple waves, we took the average of the weights across the survey waves used to compute the outcomes.

S8.6 Data collection timeline

Data collection began with a soft launch on August 31, 2020 and continued through March 2, 2021. The dates of each field wave were as follows:

- Wave 1: A subsample of Facebook-recruited respondents were invited to the survey on August 31 in a soft-launch. The remainder of sampled Facebook-recruited respondents were invited to the survey on September 1. The recruitment of the sample continued until Saturday, September 12. The wave included the recruitment and consent processes and a short survey.
- Wave 2: The field period for Wave 2 started on September 8 and continued through September 23. The wave included a baseline survey and was conducted prior to randomization.
- Wave 3: The field period for Wave 3 started on October 9 and continued through October 23.
- Wave 4: The field period for Wave 4 started on November 4 at 12:05 am Central Time and continued through November 18.
- Wave 5: The field period for Wave 5 started on December 9 and continued through December 23. The survey started approximately one week later than the original schedule due to obtaining approvals for updated informed consent language.

During this period, the platform interventions ran from September 24 to halfway through the day on December 23, 2020.

S8.7 Response rates

In Table S54, which shows the response rates, eligible users sampled (A) is based on the sampling methods described in Section S8.1. The number of participants passed to NORC (P) is lower than those who consented to the full study (F), because not all users successfully followed the URL link to the NORC website. Eligibility confirmed by NORC (Q) is based on respondent age (above 18), country (US), and removing duplicate cases. The number of people who declined to participate as shown in the CONSORT flow diagram (Figure S1) include those who did not consent to the full study during the pre-NORC recruitment period (G) and those who withdrew before Wave 3 and randomization (AG).

Table S54: Survey completion and response rates

Row	Measure	Interventions	Definition
Pre-NORC recruitment			
A	Eligible users sampled	22,965,580	
B	Viewed recruitment	14,643,120	
C	Clicked on recruitment	988,247	
F	Consented to full study	193,880	
G	Did not consent to full study	794,367	C-F
J	Recruitment viewers among sampled	63.8%	B/A
K	Recruitment clickers among recruitment viewers	6.7%	C/B
N	Consented among asked	19.6%	F/C
O	Response rate before pass to NORC	0.8%	J*K*N
Wave 1			
P	Passed to NORC	189,792	
Q	Screened for eligibility	163,207	
R	Confirmed eligible	162,698	
S	Completed wave 1	139,193	
T	Wave 1 completion rate among passed to NORC	86.0%	Q/P
U	Eligibility rate among screened	99.7%	R/Q
V	Interview completion rate among eligible	85.6%	S/R
W	Response rate among those passed to NORC	73.6%	T*V
X	Cumulative response rate, pre-NORC recruitment wave 1	0.6%	O*W
Wave 2			
Y	Screened for eligibility	77,438	
Z	Confirmed eligible	77,405	
AA	Completed wave 2	75,276	
AB	Screening completion rate among invited	55.6%	Y/X
AC	Eligibility rate among screened	100.0%	Z/Y

AD	Interview completion rate among eligible	97.3%	AA/Z
AE	Response rate among invited, wave 2	54.1%	AB*AD
AF	Cumulative response rate, pre-NORC recruitment waves 1 2	0.3%	X*AE
<hr/>			
Wave 3			
AG	Withdrawn before wave 3	87	AA-AH
AH	Invited	75,189	
AI	Completed wave 3	56,866	
AJ	Interview completion rate among invited	75.6%	AI/AH
AK	Response rate among invited + withdrawn, wave 3	75.5%	AI/(AM+AN)
AL	Cumulative response rate, pre-NORC recruitment waves 1 2 3	0.3%	AF*AK
<hr/>			
Wave 4			
AM	Withdrawn before wave 4	138	AA-AN
AN	Invited	75,138	
AO	Completed wave 4	56,195	
AP	Interview completion rate among invited	74.8%	AO/AN
AQ	Response rate among invited + withdrawn, wave 4	74.7%	AO/(AM+AN)
AR	Cumulative response rate, pre-NORC recruitment waves 1 2 4	0.3%	AF*AQ
<hr/>			
Wave 5			
AS	Withdrawn before wave 5	169	AA-AT
AT	Invited	75,107	
AU	Completed wave 5	54,208	
AV	Interview completion rate among invited	72.2%	AU/AT
AW	Response rate among invited + withdrawn, wave 5	72.0%	AU/(AS+AT)
AX	Cumulative response rate, pre-NORC recruitment waves 1 2 5	0.2%	AF*AW
<hr/>			
Three-Wave (W1 W2 (W4 or W5))			
AY	Completed waves 1 2 (4 or 5)	58,886	
AZ	Interview completion rate for wave 4 or 5 among wave 2 completes	78.2%	AY/AA
BA	Cumulative response rate among cases sent to NORC, waves 1 2 (4 or 5)	31.1%	W*AE*AZ
BB	Cumulative response rate, pre-NORC recruitment waves 1 2 (4 or 5)	0.3%	AF*AZ
<hr/>			

In the next two tables we report features of the distribution of selected covariates (logged on Facebook, not from survey responses) across survey waves in relation to the population of users. Table S55 reports the marginal distribution of age, gender, predicted ideology, and swing state. Table S56 reports the average of the following covariates: number of political Pages followed, normalized time spent on Facebook, number of friends on Facebook, and the number of days a users was active on the platform in the 30 days prior to the definition of the sampling frame (L30). In general, we see that in relation to the population, the sample of participants is slightly older, predicted to be more liberal, and more active on Facebook. However, we see that the distribution of covariates does not change much across survey waves.

Table S55: Marginal distribution of selected covariates in the platform population and participants' sample (Facebook)

Covariate	Population	Pre-treatment		Post-treatment		
		Wave 1	Wave 2	Wave 3	Wave 4	Wave 5
Age: 18-27	0.22	–	0.14	0.14	0.14	0.14
Age: 28-35	0.18	–	0.23	0.24	0.24	0.24
Age: 36-46	0.20	–	0.28	0.28	0.29	0.28
Age: 47-59	0.20	–	0.21	0.21	0.21	0.21
Age: 60+	0.20	–	0.13	0.13	0.13	0.13
Gender: Female	0.54	0.55	0.56	0.57	0.58	0.58
Gender: Male	0.46	0.46	0.44	0.43	0.42	0.42
Predicted Ideology: Conservative	0.44	0.38	0.34	0.33	0.33	0.32
Predicted Ideology: Liberal	0.26	0.44	0.43	0.44	0.45	0.45
Predicted Ideology: Moderate	0.30	0.18	0.23	0.23	0.23	0.23
Swing State: No	0.60	0.64	0.65	0.65	0.65	0.65
Swing State: Yes	0.40	0.36	0.35	0.35	0.35	0.35

Note: Age, as logged on Facebook, was not available for wave 1 respondents.

Table S56: Average values of selected covariates in the platform population and participants' sample (Facebook)

Covariate	Population	Pre-treatment		Post-treatment		
		Wave 1	Wave 2	Wave 3	Wave 4	Wave 5
# of political Pages followed	11.02	–	31.37	30.29	30.42	30.24
Time Spent FB	0.00	0.93	0.74	0.73	0.73	0.73
# of friends	449.33	673.46	593.02	567.34	569.09	568.27
L30	23.19	29.12	29.21	29.24	29.25	29.26

Note: The number of political pages followed by users on Facebook was not available for wave 1 respondents.

Participants generating the survey data we analyze in this study were paid a total sum of \$987,880 for completing the surveys (Waves 1 and 2 and Wave 3, 4, or 5). The total sum of incentives paid to survey participants in the AmeriSpeak panel, which are analyzed in the SM for the sample comparisons (Section **S3.3**), is \$215,155.

S9 Passive Tracking Data

Participants who completed Wave 1 of the study and provided valid email addresses were asked for their consent to track their mobile and desktop internet browsing behavior.

To collect the passive measurement data, NORC partnered with two vendors: MDI Global and RealityMine. Users who consented to passive data tracking were asked to install an app and use a virtual private network (VPN) on their mobile or desktop devices to collect data about the number of visits and time spent on different web domains, as well as usage and time spent on apps on their mobile device. The app was developed by MDI Global and the VPN was developed and maintained by RealityMine. Both firms collected the passive tracking data and sanitized, truncated, and/or categorized the URLs to minimize the risk of sharing any additional personally identifiable information (PII).

The passive measurement software collected data on which applications participants were using and for how long on mobile devices, but no data were collected on what participants were doing within those applications. On all devices, information was collected on the websites that participants were visiting, but no additional information was collected beyond the domain name. For instance, a participant searching for information on “election night meals” on Google would be logged as www.google.com rather than <https://www.google.com/search?q=election+night+meals>. Further, k-anonymization was applied to the domain-level data by excluding domains that had visits from fewer than 20 unique panelists. The applications and VPNs only collected data while installed on a participant’s device. The software could be uninstalled at any time and data collection could be paused using functionality in the apps.

To recruit participants for the passive measurement, the respondent’s email address provided in Wave 1 of the Facebook sample survey was used to invite respondents to enroll. Participants whose email addresses were valid were invited to download the passive monitoring software between September 11 and September 21, 2020.

The recruitment language was as follows:

Subject: 2020 Election Research Project: Additional Study Opportunity

As a member of the 2020 Election Research Project, you have been selected to participate in an additional study to learn more about the apps you use and sites you visit.

You can earn up to \$90 for choosing to participate in this additional study. To participate, you only need to install the software and keep it active for the 3 month study

NORC at the University of Chicago and the study sponsor, Facebook, would like to understand more about how you’re using your device during this study. To participate, you’ll need to

download software to your device. When installed, this software will automatically collect data about your device and the websites you visit and apps you use. The data will only be used for research purposes. Please note that passwords, and other information you might enter on websites, like your banking details, will not be collected.

Those who clicked to learn more were provided with the following additional information: NORC at the University of Chicago and the study sponsor, Facebook, would like to understand more about how you're using your device during this study. To participate, you'll need to download an app, install a Virtual Private Network (VPN), or a browser plugin to your device. This software is developed by NORC's partners, MDI and RealityMine. When installed, this software will automatically collect data about your device and how you use it as further specified below, and no further action will be required from you. Please note that passwords, and other information you might enter on websites, like your banking details, will not be collected. You may install the software on one or more devices.

Installing this software is completely optional. Should you choose to install it, researchers at New York University, The University of Texas at Austin, and other academic institutions, as well as Facebook will use the data to better understand how online behavior changes in response to events during the course of the study. More information on this software can be found here: (FAQ information appended below).

Earn \$5 per device just for installing and setting up the software. For your first 2 weeks of data sharing, earn an additional \$5 per device (maximum 2 devices). You'll then earn another \$5 per device at the end of your first month, if your devices are still sharing data. That means you could earn up to \$30 in your first month! Keep participating and you'll earn \$10 per month, per device. If you complete all 3 months, you'll receive a bonus \$20 for 2 devices, or \$15 for one device. This means you can earn up to \$90 for 3 months of participation in this study! You will be paid for a maximum of 2 devices, though you may install the software on as many devices as you'd like. You may forfeit the monthly payment if you fail to send data from your mobile device for 3 days in a row or from your computer for 8 days in a row.

- All of your mobile device's data will flow through a VPN connection on iOS
- Web data for specific browsers will flow through a VPN on Android
- All of your desktop or laptop data will flow through a browser plugin
- Of the data that flows through the VPN or browser plugin, NORC will collect data on:
 - Your operating system, device model and manufacturer, and device type (e.g., mobile, tablet, desktop)
 - Which apps you use, including app name and category, the date and time you use the app, and for how long

- Which browser you use and technical details about your session such as your IP address
 - What websites you visit, the date and time you visit a website, when and for how long
- NORC will use this data in order to facilitate the research and for data quality assurance purposes
- Of the data collected, the following device data will be shared with Facebook and Facebook’s academic research partners:
 - Your operating system, model and manufacturer, and device type (e.g., mobile, tablet, and desktop)
 - Which apps you use, including app name and category, and for how long
 - Which browser you use
 - What websites you visit, the date and time you visit a website, when and for how long
- Your device data will be linked to your survey responses as well as publicly available third-party data, like if you’ve voted or made a political contribution, if this third-party data is available
- Your device data will not be used for ads
- Facebook will also combine your device data, your survey responses and the third-party data with your activity on Facebook from the 2020 calendar year, collectively called Combined Data
- This Combined Data will be shared with Facebook’s academic partners and, if legally required, with the Institutional Review Board (IRB) that reviewed this study.
- Once this study is over, de-identified data (i.e. data where identifiers such as your name and other information that could reasonably be linked to you are removed) will be stored and shared for future research on elections, to validate the findings of this study, or if required by law for an IRB inquiry.

The FAQ included the following:

Along with your traditional surveys, this study gives you the opportunity to add software to your online devices to understand mobile and desktop behavior.

How does it work?

On mobile (Android/iOS) we use VPN services to understand web data usage on those devices, from which we can understand what sort of websites you visit. We also use this web data on iOS, or OS information on Android, to see what your favorite applications are. You can also download the application onto Windows and Mac which installs Browser Extensions onto Chrome, Firefox and Safari depending on what browsers you have installed.

What data do you collect?

We can collect data on what apps you are using and for how long on mobile, but we do not see what you do within those applications. Across all platforms we also collect information on what websites you have been on, for instance we could see if you have been using Google or YouTube on your browser, however we would not be able to see what you were searching or viewing on those channels, e.g. www.google.com was used for 5 minutes

Can I stop data being collected?

The applications and VPNs will only collect data whilst installed on your device. You may uninstall at any time or even pause data collection using functionality in the apps.

What else do the apps do?

The apps will sit in the background and passively collect data, meaning all you need to do is keep them installed to earn your rewards. The Android and iOS applications will send you notifications periodically to keep you up to date with the study, for instance letting you know when there is a survey to complete.

Participants also were given a link to more privacy details and terms, as well as provided with a website allowing them to withdraw from the study at any time. The passive measurement recruitment phase closed on September 21, 2020. A total of 51,435 Wave 1 respondents provided consent to participate in the study, of which 21,198 (41%) downloaded, installed and activated the software on at least one device on a total of 29,700 devices.

Table [S57](#) shows the participation rates for online passive tracking. This table pertains to the entire on-platform intervention sample. Total active devices is larger than total compliant users because some users have more than one device.

Table S57: Online passive tracking participation rates

	All Platform interventions
Invited sample	125,694
Completed enrollment survey	20,822
Enrollment survey yield (complete/invited)	17%
Consent to participate	20,077
Consent rate (consent/complete)	96%
Total compliant users – Sept. 21	7,730
Total compliant users – Oct. 19	7,104
Total compliant users – Nov. 23	6,980
Total compliant users – Dec. 23	6,485
Active rate (active users/consent) – Sept. 21	39%
Active rate (active users/consent) – Dec. 23	32%
Total active devices – Sept. 21	10,421
Total active devices – Oct. 19	9,016
Total active devices – Nov. 23	9,078
Total active devices – Dec. 23	8,219
Deactivated (users) – Dec. 23	123
Non-compliant (users) – Dec. 23	5,358
Total user universe (Active+Deactivated+Non-Compliant)	11,966
Rate of dropout (users)	46%

S10 AmeriSpeak sample

In addition to our main study sample, a nationally representative general population sample of U.S. adults age 18+ who had responded to an AmeriSpeak survey invitation in the previous six months was selected from NORC's AmeriSpeak Panel for this study.

The wave 2 sample was selected from the AmeriSpeak panel using sampling strata based on age, race/Hispanic ethnicity, education, and gender (48 sampling strata in total). The size of the selected sample per sampling stratum was determined by the population distribution for each stratum. In addition, sample selection took into account expected differential survey completion rates by demographic groups so that the set of panel members with a completed interview for the study is a representative sample of the target population (general population age 18+). For panel households having more than one active adult panel member, only one adult in the household was eligible for study selection (random within-household sampling). Panelists selected for an AmeriSpeak study earlier in the business week are not eligible for sample selection until the following business week.

For technical information about the AmeriSpeak panel, including recruitment process and panel management policies, see <https://amerispeak.norc.org/research>.

All non-withdrawn respondents from AmeriSpeak who completed the wave 2 survey were invited to waves 3–5 regardless of whether they completed any of the other waves.

S11 Meta-Academic Collaboration Overview

The *U.S. 2020 Facebook and Instagram Election Study* was designed to address three intertwined concerns related to scientific understanding of the impact of social media on democratic processes. First, in the aftermath of the 2016 US elections, there was a widely recognized need to understand the impact of social media platforms on US elections. Second, research conducted solely by employees of these same platforms could possibly encounter skepticism from the mass public and policy community. At the same time, outside independent researchers not employed by the platforms faced legal and fiduciary challenges in securing access to the data and research pipelines to conduct the types of necessary rigorous scientific analyses to answer questions about the impact of social media platforms on elections.

The *U.S. 2020 Facebook and Instagram Election Study* is an attempted solution to this bundle of challenges. The project represents a novel form of collaboration between a team of researchers at Meta and a set of external researchers. The costs associated with the research (e.g., participant fees, recruitment, data collection, etc.) were paid by Meta. The academic team members received no form of financial compensation (e.g., support for student assistants, course buyouts, research funds) from Meta for their participation in the project.

Professors Natalie Jomini Stroud of the University of Texas at Austin and Joshua A. Tucker of New York University, at the time Chairs of the North American Regional (Stroud) and Electoral Integrity (Tucker) Social Science One Advisory Committees, selected and co-chaired a team of 15 additional external academic researchers (that is, researchers not employed by Meta); as part of the agreement, Meta did not have veto power over the academics selected for the team. Although there were many qualified researchers who could have been involved, the original members of the academic team for this project were selected based on their prior involvement with Social Science One and their expertise in social media and politics. Additional researchers were brought on as needed based on their substantive and methodological expertise.

Chad Kiewiet de Jonge was the Meta research manager who oversaw day-to-day management of the research project at Meta. Annie Franco and Winter Mason co-led the Meta research team, which grew to include 16 researchers, 2 data engineers, 1 data scientist, and 3 interns working on various parts of the overall project.

Once assembled, the team of academics met beginning in March of 2020 to first brainstorm research ideas within the project's mandate of studying Facebook and Instagram's impact in the context of the 2020 elections and then to develop ideas for specific paper proposals. Concurrently, the team of Meta researchers began working with the academic team to provide feedback on research proposals, including the feasibility of possible designs and procedures for collecting the necessary data. As a result of this process, four general areas of inquiry were selected to form the scope of project: (1) dis/mis/information, knowledge, and (mis)perception; (2) political polarization; (3) political participation, both online and offline, and including vote choice and turnout; and (4) attitudes and beliefs about democratic norms and the legitimacy of democratic institutions.

The next step in the project involved identifying specific paper topics within these general

scope conditions. Based on their research interests, a subset of academic researchers served as “core authors” of each paper and were given control rights over final versions of the pre-analysis plans and papers.^{S11} Both the academic researchers and the Meta researchers worked together to design the pre-analysis plans.

Data collection was carried out by Meta and NORC, an independent survey research organization at the University of Chicago.^{S12} Meta recruited most participants (see Section S8.1 for details) and collected on-platform data, while NORC carried out all surveys associated with the project, collected and appended all supplemental data outside of the Facebook/Instagram on-platform data, and recruited additional survey panelists. The academic research team did not contact any human subjects as part of the research efforts. In the rare cases where members of the academic team – who had been publicly announced – were messaged by study participants, the messages were passed to NORC to respond.

At the data analysis stage, the Meta team produced, and the academics reviewed and approved, pipeline code used to produce the data tables needed for this project from raw platform data (e.g. number of followers) and data created for other internal Meta purposes (e.g. predictions of ideology of U.S. Facebook users) that were employed in the analysis. The Meta researchers and, in some instances, the academics, carried out the initial analyses as detailed in the pre-analysis plan and as deemed necessary by the full research team for mutually agreed upon research-relevant analyses. The academics’ role in the analysis was to contribute to and monitor the results of data analyses conducted by the Meta research team, including: reviewing and, in some cases writing, code; inspecting de-identified samples or aggregated outputs through screen sharing; and, when possible, replicating the analyses within Meta’s secure data-sharing Researcher Platform using data that has been stripped of any individually-identifying information.

Drafts of papers were written by the academic research team members, with feedback from the Meta academic researchers but with final control rights resting with the specified core academic authors.

A full description of the roles and responsibilities of the academic research team, the Meta researchers, and NORC can be found at the Open Science Foundation.^{S13} A public FAQ answering common questions about the U.S. 2020 Facebook & Instagram Election Study is available here: https://medium.com/@2020_election_research_project/266d30cbe95b.

Research transparency and integrity: One of the primary goals in designing the project was to build in transparency concerning the research process given the constraints under which we

^{S11}By *control rights*, we mean that in the event of disagreements between members of the research team, the core authors would have the final say in resolving these disagreements.

^{S12}NORC was selected following a competitive bidding process involving other online survey research firms. To be clear, employees of NORC who implemented the data collection process were not members of the academic research team. More details about NORC can be found at: <https://www.norc.org/Pages/default.aspx>.

^{S13}<https://osf.io/upkns/>

were operating. With this in mind, five conventions were adopted to guide the research process.

First, none of the academic researchers nor their institutions received financial compensation (e.g., support for student assistants, course buyouts, research funds) from Meta for their participation in the project.

Second, the analysis for all the papers resulting from the project, including this one, were preregistered at the Open Science Foundation. The pre-registrations were embargoed while the research was being carried out, but are being made available to reviewers and will be publicly released at time of publication.

Third, for every paper, a set of core authors with control rights over the final content of the paper were specified in the pre-analysis plan. These core authors consist only of academic researchers (i.e., not employees of Meta).

Fourth, Meta publicly agreed that there would be no pre-publication approval of papers for publication on the basis of their findings. At the time the PAPs were proposed – but before any data analysis was conducted – Meta conducted legal, privacy, and feasibility reviews of the studies. Meta was entitled to review papers prior to publication, but could only request changes to protect confidential or personally identifiable information or to abide by existing legal obligations.^{S14}

Fifth, we appointed a rapporteur for the project – Professor Michael Wagner of the University of Wisconsin, Madison – who was neither a paid employee of Meta nor a member of the academic research team. The rapporteur was given access to all participants, allowed to join project-related meetings, and had access to project documents. The rapporteur will not be a co-author on any of the papers resulting from the study, but the expectation is that the rapporteur will publish both academic and popular press articles assessing the research process itself.

Finally, Meta plans to make de-identified datasets from each published study conducted under this initiative and designed in collaboration with the academic team available to the broader research community, so that others can reproduce the analyses and conduct further election studies.

Below we list declarations from the academic author team. For consistency, we use the following key:

^{S14}<https://about.fb.com/news/2020/08/research-impact-of-facebook-and-instagram-on-us-election/>.

a	Current employee (Meta)
b	Past employee (Meta)
c	Own individual stocks (Meta)
d	Paid consulting work (Meta)
e	Direct research funding from Meta (grant to you as PI or Co-PI)
f	Received an honorarium/fee (from Meta) for attending or hosting an event/serving as outside expert
g	Attended a Meta event where food, travel, or lodging was paid for by the company
h	Current employee (at a related company: Twitter, TikTok, Google/YouTube)
i	Past employee (at a related company)
j	Own individual stocks (at a related company)
k	Paid consulting work (at a related company)
l	Direct Research Funding from a related company (grant to you as PI or Co-PI)
m	Received an honorarium/fee (from a related company) for attending or hosting an event/serving as outside expert
n	Attended an event (at a related company) where food, travel, or lodging was paid for by the company

Author declarations: Hunt Allcott: former Microsoft employee; none of the above. Deen Freelon: g. Matthew Gentzkow: f, g, m, n. Sandra González-Bailón: g, l. Andrew Guess: e, g. Edward Kennedy: no declarations. Young Mie Kim: g. David Lazer: g, n. Neil Malhotra: g, n. Brendan Nyhan: e, g, n. Jennifer Pan: e, f, g. Jaime Settle: c, e, g, j. Natalie Jomini Stroud: d, e, g, l, n. Emily Thorson: g. Rebekah Tromble: e, g, l. Joshua A. Tucker: e, f, g, n. Magdalena Wojcieszak: e, g, n.

We also provide the following additional disclosures:

- Ancillary support (e.g., research assistants, course buyouts, etc.) was sourced by academics from the Democracy Fund, the Guggenheim Foundation, the John S. and James L. Knight Foundation, the Charles Koch Foundation, the Hewlett Foundation, Hopewell Fund, the Alfred P. Sloan Foundation, the University of Texas at Austin, New York University, Stanford University, the Stanford Institute for Economic Policy Research, the University of Wisconsin-Madison.
- Hunt Allcott received compensation from another source for consulting on a matter related to Meta's business. H.A. was an employee of Microsoft Research until December 2022.
- Matthew Gentzkow received compensation from Compass Lexecon for advice on a project for which Meta was the client. He has been a paid consultant for Amazon and done economic consulting for Analysis Group for clients including Google. He has received compensation as a member of the Toulouse Network for Information Technology, a research group funded in part by Microsoft.

- Brendan Nyhan has served as a member of the Misinformation Interventions Working Group at Meta since 2022. Meta has donated the honorarium he would receive for participating in this group to Doctors Without Borders on his behalf.
- Jennifer Pan served as a member of Meta’s News Integrity Circle from fall 2020 to fall 2022. She received an honorarium for participating in the fall 2020 and spring 2021 session; the honorarium she would have received for participating was donated to Reporters without Borders for the fall 2021, spring 2022, and fall 2022 sessions.
- Natalie Jomini Stroud provided consultant services to Facebook in 2018–2019 on a prior research project; she was paid before the current project began.
- Joshua A. Tucker received a fee from Facebook to compensate him for administrative time spent in organizing a 1-day conference for approximately 30 academic researchers and a dozen Facebook product managers and data scientists that was held at NYU in the summer of 2017 to discuss research related to civic engagement; his fee was paid before the current project began. He is currently a Kroll Institute Fellow and Senior Advisor at Kroll.

S12 Additional Ethical Considerations

Researchers involved in the project considered a number of ethical concerns related to the research and designed the studies to minimize potential harms to the respondents involved in them, as well as any broader social harms.

S12.1 Ethics and Individual Participants

All experimental treatments involve withholding components of Facebook or Instagram that have been identified in the academic literature as having potentially negative effects (e.g., feed algorithms). Individual-level participation in the experimental analyses and surveys was compensated and required informed consent (for details see section [S8.2](#)). We believe that the societal benefits of the study (e.g., the knowledge about Facebook and Instagram’s impact in the election that will be generated) outweigh its potential harms to respondents, which will not be larger than what individuals experience in their ordinary life. Accordingly, Meta sought review from and was granted approval to conduct the experimental studies by the NORC Institutional Review Board (Protocol number 20.08.10, Project number 8870). Academic collaborators worked with their respective university IRB’s to ensure compliance with Human Subjects Research regulations in their authorship of papers, including analysis of aggregated, de-identified data collected by Meta and NORC.

S12.2 Re-identification Risk

For the individual-level data, the following variables were coarsened to reduce re-identification risks.

- INCOME (18 categories) → INCOME (3 categories: less than \$49,999, \$50,000 to \$99,999, \$100,000 or more); see Wave 1
- EDUCAT (14 categories) → EDUC5 (5 categories: less than high school, high school diploma, vocational degree / some college, college degree, graduate degree); see Wave 1
- HISPAN (8 categories), RACE_1 (15 categories) → RACETHNICITY (6 categories: White, non-Hispanic; Black, non-Hispanic; Other, non-Hispanic; Hispanic; 2+ non-Hispanic; Asian, non-Hispanic); see Wave 1
- ZIP (41,692 categories) → IS_SWING_STATE (2 categories based on Cook Political Report); see Wave 1
- ZIP (41,692 categories) → IS_SWING_CD (2 categories based on Cook Political Report); see Wave 1
- RELIGION (12 categories) → RELIGION (4 categories: Protestant, Roman Catholic, Mormon, Eastern or Greek Orthodox & not born-again; Protestant, Roman Catholic, Mormon, Eastern or Greek Orthodox & born-again; Jewish, Muslim, Buddhist, Hindu, Something else; Atheist, Agnostic, Nothing in particular); see Wave 5

S12.3 Ethics and Experiments During an Election

As a mitigation strategy to minimize unanticipated negative effects, we implemented a stopping rule, inspired by clinical trials, which would have ended a treatment if we detected that it was generating changes in specific variables relevant to individual welfare that were much larger than expected. The stopping rule was pre-registered at the Open Science Foundation: <https://osf.io/upkns/>; here we provide a brief summary of the stopping rule document.

We would have stopped the treatment and re-assigned users to the same feed experience as the control if any of the following conditions had been met:

- Treatment reduced turnout intention by significantly more than five percentage points (relative to control)
- Treatment reduced registration rates by significantly more than five percentage points (relative to control)
- Treatment increased exposure to content from untrustworthy sources (as a proportion of Feed content, defined as content by Pages and Groups (or including a link to a Domain) on Facebook with 2+ lifetime misinformation strikes) by significantly more than 10 percentage points (relative to control)

- Treatment increased exposure to content rated “False” by one of Meta’s independent fact-checking partners, or copies of such content as determined by text, image, and video matching algorithms, by significantly more than 10 percentage points (relative to control).

Checks for these stopping rules were carried out on October 26, 2020. We found that the estimated effects for all of these outcome variables were well below the thresholds that would trigger the stopping rule. Based on that evidence, the experimental treatment ran until the original pre-registered dates.

An additional concern related to running experimental studies during an election period is the downstream risk of inadvertently impacting the outcome of an election. In order to mitigate against this possibility, we calculated the largest possible impact on an election outcome we could expect from our study as part of the process of designing the size of our treatments. As the study was designed, the number of people recruited into any of the treatment groups would have been at most 0.044% of the citizen voting-age population in the US (i.e., citizens who are eligible to vote). Participants were distributed randomly across the US, with some oversampling of people in battleground states. Under the largest effect scenario, i.e. that in which our interventions have the same effect as mobilization or persuasion campaigns, we would expect at most a change of 49 votes (in either direction) in the largest state or 1 vote (in either direction) in the largest congressional district;^{S15} and an increase in turnout of at most 1,175 votes in the largest state and 35 votes in the largest congressional district.

S12.4 Professional Ethics Advice

Meta retained the services of *Ethical Resolve*, a data ethics firm that was consulted by both Meta and academic researchers at various stages of the project prior to implementation of the research to evaluate whether it met long-running traditions of research ethics as well as emerging norms and best practices for conducting digital research.^{S16}

^{S15}To be clear, there were no experiments included in the study that we expected to benefit any particular candidate; these are simply the largest effects we could expect to occur *in either direction* based on prior research.

^{S16}<https://ethicalresolve.com/>

S13 Pre-Analysis Plan Deviations and Clarifications

We disclose the following deviations from the pre-analysis plan (PAP), along with the justifications for altering the PAP.

Deviation #1 (see p. 12 of PAP): We had originally proposed coding vote choice for down-ballot races as “the sum of votes for a Republican candidate from 0 to 3.” We instead code this variable as “the sum of votes that are consistent with party identification (including leaners), divided by the total of non-missing responses on these three items.” The initial definition did not consider that the number of races varies across respondents. Further, coding the variable in terms of “party-line voting” matches the operationalization of vote choice at presidential level.

Deviation #2 (see p. 10 of PAP): We had originally planned on collecting online consumption of political news (tracking data) as the count of visits to political news domains. Due to privacy concerns, we had to exclude domains with less than 20 unique visitors.

Deviation #3 (see p. 10 of PAP): We originally operationalized perceived polarization as the difference in perceived ideology between one’s in-group and one’s outgroup. We instead code perceived polarization as the average absolute difference between perceived position of each pair of groups. The original definition was hard to interpret, and the revised definition is closer to what is meant by “perceived polarization” in the literature.

Deviation #4 (see p. 21 of PAP): We originally proposed that unless otherwise specified, for variables based on log data (either covariates or outcome variables), we winsorize at the 99th percentile. We ultimately did not winsorize variables that are used solely to compute proportions. This is because winsorization is only necessary to deal with outliers. By construction, proportions will not have outliers. In addition, winsorization in inconsistent ways for the numerator and denominator may add additional noise to the proportions.

Deviation #5 (see p. 24 of PAP): We originally proposed a non-parametric estimation of variable importance. In practice, we found that this approach lead to large amounts of variance. Instead, we use a linear measure of variable importance, which is computed as the difference in mean squared-error between a model incorporating all covariates and one which leaves out a particular moderator.

Deviation #6 (see pp. 23–24 of PAP): The PAP states that we will report partial moderation effects (PCATEs), but we do not do so because they require a causal interpretation that is not strictly justified by our design. We still report marginal moderation effects (MCATEs), which correspond to the standard notion of the conditional average treatment effect (CATE).

Deviation #7 (see pp. 3, 11–12 of PAP): The PAP states that we will analyze polarization of links shared on Twitter. However, the final sample only included 1,889 panelists with at least one tweet containing a link to a news story during the study period. There was not sufficient data to do this analysis; there was even less available data than for analyzing pre-treatment web tracking data (see Clarification #11 below).

Deviation #8 (see p. 9 of PAP): We now refer to the “hateful and intolerant speech classification method” as the “content with slur words classifier” (see Section S7).

In addition to these explicit deviations, we also report the following clarifications for items that were somewhat unclear in the filed PAP:

Clarification #1 (multiple pages of PAP): The PAP did not provide details on how to deal with missingness in survey items that need to be combined into composite scales. We impute missing values using the median (for categorical values) or the mean (for continuous values) for respondents who completed at least one of the items used to build the composite scale. Respondents who skipped this wave or all items within the scale are excluded from the analysis that relies on this scale.

Clarification #2 (see p. 7 of PAP): The PAP had conflicting information on how to score correct answers for the news knowledge items. We decided to use a scale that ran from -2 to +2 per the PAP.

Clarification #3 (see p. 4 of PAP): We originally defined a dependent variable as “Trust in information from non-social media.” We instead define the variable as “Trust in information from mainstream and liberal news outlets” given that trust in Fox News did not load on the same scale, and per the PAP, we dropped items from indices that did not load well (see SM section on Factor Loadings of Survey Scales).

Clarification #4 (see p. 17 of PAP): We reported that we would collect inventory on the log data. We clarify that we collect both the inventory count, and a version of this variable in terciles.

Clarification #5 (see p. 17 of PAP): We reported that we would collect data on social media activity level. We clarify that this is measured as terciles of composite index based on engagement counts, activity level (L28 and VPV count), and time spent on platform.

Clarification #6 (see p. 17 of PAP): We reported that we would define race as white vs. non-white. We clarify that we define race as non-Hispanic white vs. non-white/Hispanic to be consistent with other sections of the PAP.

Clarification #7 (see p. 21 of PAP): We indicated a list of variables to be used to assess covariate balance without specifying whether they would be measured categorically or continuously. We used categorical (as opposed to continuous) coding to be consistent with other areas of the PAP.

Clarification #8 (see p. 18 of PAP): We not not specify whether descriptive statistics should be weighted. Since the purpose is not to understand the impact of intervention on respondents, we do not apply weights.

Clarification #9 (see p. 18 of PAP): When discussing treatment effect estimation, we wrote that we would include stratum indicators. We clarify that we include covariates used for block randomization. The original language was confusing because sampling strata are different from covariates used for block randomization, but the intention here (consistent with most common model specifications) was to use block randomization covariates.

Clarification #10 (see p. 17 of PAP): The PAP indicated that we would analyze “news interest” as a secondary moderator if data were available. There was not sufficient pre-treatment web tracking data so the data were not available for this analysis.

Clarification #11: We do not currently report the full set of model diagnostics for our het-

erogeneous treatment effects analyses (see p. S-24). These will be made available as part of our public replication materials.

Clarification #12: For reshares, our engagement metrics include reshares of all posts regardless of the “surface” or interface (including Feed, Groups Tab, News Tab, user profiles, Stories, etc.) where it occurred and not only Feed, because we are not able to identify the surface on which a user was when they reshared a post. For metrics that seek to capture reshare rates that are normalized by exposure counts, such as those in Table S15, this introduces inconsistencies between the surfaces used in the numerator and the denominator. To demonstrate that this choice does not impact our findings, Table S58 replicates the metrics reported in Table S15 but using exposure counts across all surfaces as denominator. Although the engagement rates vary, as expected, we generally find that the interpretation of our results remains similar, which is consistent with the fact that Feed posts represent approximately 90% of all views among respondents in our study.

Table S58: Engagement metrics as a share of exposure on Facebook, disaggregated and using only NewsFeed views or all views as denominator for reshare rates

Metric	Group	p5	p50	p95	Avg.	SD	N	diff
Comment/reshare rate (over NewsFeed views)	Control	0	0.62	7.79	1.97	4.79	16057	–
	Treatment	0	0.58	7.06	1.9	8.13	7198	p=0.55
Comment/reshare rate (views on all surfaces)	Control	0	0.55	6.84	1.72	4.09	16057	–
	Treatment	0	0.51	5.97	1.63	6.74	7198	p=0.32
Reshare rate (over NewsFeed views)	Control	0	0.07	2.29	0.52	2.04	16057	–
	Treatment	0	0.05	1.68	0.47	3.98	7198	p=0.32
Reshare rate (views on all surfaces)	Control	0	0.06	2.07	0.47	1.84	16057	–
	Treatment	0	0.04	1.48	0.42	3.65	7198	p=0.28
Comment rate	Control	0	0.42	5.84	1.45	3.9	16057	–
	Treatment	0	0.42	5.46	1.43	6.34	7198	p=0.87

147 observations (0.63%) dropped by listwise deletion.

S14 Questionnaires

Survey Questionnaires

Wave 1

Client	Facebook
Project Name	ERP 2020
Project Number	8870
Survey length (median)	10 minute survey
Population	CONSENTED FB/IG USERS
Main	N=309,243
MODE	CAWI WEB ONLY
Language	English/Spanish
Sample Source	Facebook Instagram recruited sample
Incentive	\$0
Survey description	WAVE 1 ENROLLMENT Election and Politics Study 2020
Eligibility Rate	100%

LANGSWITCH.

Welcome to the 2020 Election Research Project Bienvenidos al Proyecto de Investigación Electoral 2020

Let's get started with an easy question.
Empecemos con una pregunta fácil.

This survey is currently available in English and Spanish. Which language would you prefer to use to share your opinions?

Esta encuesta está actualmente disponible en inglés y en español. ¿Qué idioma prefiere usar para compartir sus opiniones?

1. English/Inglés
2. Spanish/Español

DISPLAY – OPTINTRO.

Thank you for enrolling in the **2020 Election Research Project!**

¡Gracias por inscribirse en el Proyecto de Investigación Electoral 2020!

This study is going to ask about your opinions, and will help researchers at New York University, The University of Texas at Austin, and other academic institutions, as well as Facebook, understand more about how people's experience with Facebook and Instagram affects their attitudes and behaviors concerning elections.

Este estudio va a pedir sus opiniones, y ayudará a los investigadores de la Universidad de Nueva York, la Universidad de Texas en Austin, y otras instituciones académicas, así como Facebook, a entender más acerca de cómo la experiencia de la gente con Facebook e Instagram afecta sus actitudes y comportamientos en relación con las elecciones.

After you complete the enrollment today, we will be sending you four more surveys between September and December. You'll be paid at least \$30 for participating in this study and completing all four surveys.

Después de que complete la inscripción hoy, le enviaremos cuatro encuestas más entre septiembre y diciembre. Se le pagará al menos 30 dólares por participar en este estudio y completar las cuatro encuestas.

Let's get started! We ask for your help today to tell us about yourself.

¡Empecemos! Le pedimos su ayuda hoy para que nos hable de usted.

GENDER.

How do you describe yourself?

¿Cómo se describe a sí mismo?

RESPONSE OPTIONS:

1. Male
2. Female
3. I identify in some other way

1. Hombre
2. Mujer
3. Me identifico de otra manera

[FORCE RESPONSE: "Please tell us your age range. We require this information for your responses to be counted"/ "Por favor díganos su rango de edad. Esta información es necesaria para contar sus respuestas."]

AGE2.

Which of the following categories includes your current age?

¿Cuál de las siguientes categorías incluye su edad actual?

RESPONSE OPTIONS:

1. 17 or younger
2. 18 to 24
3. 25 to 34
4. 35 to 44
5. 45 to 54
6. 55 to 64
7. 65+

RESPONSE OPTIONS:

17 años o menos

1. 18 a 24
2. 25 a 34
3. 35 a 44
4. 45 a 54
5. 55 a 64
6. 65+

[IF AGE2<18, TERMINATE AND SET QUAL=2]

[custom prompt: "Information about any possible Hispanic ethnicity is very important. We greatly appreciate your response to this question."]

[custom prompt: "Información sobre cualquier posible etnia hispana es muy importante. Realmente apreciamos su respuesta a esta pregunta."]

HISPAN.

This question is about Hispanic ethnicity. Are you of Spanish, Hispanic, or Latino descent?

Esta pregunta se refiere a la etnia hispana. ¿Es usted de ascendencia española, hispana o latina?

RESPONSE OPTIONS:

1. No, I am not
Yes, Mexican, Mexican-American, Chicano
2. Yes, Puerto Rican
3. Yes, Cuban
4. Yes, Central American
5. Yes, South American
6. Yes, Caribbean
7. Yes, Other Spanish/Hispanic/Latino

No, no soy

1. Sí, Mexicano/a, Mexico-americano/a, Chicano/a
2. Sí, Puertorriqueño/a
3. Sí, Cubano/a
4. Sí, Centroamericano/a
5. Sí, Sudamericano/a
6. Sí, Caribeño/a
7. Sí, otro Español/a, Hispano/a, Latino/a

RACE_1.

Please indicate what you consider your racial background to be. We greatly appreciate your help. The categories we use may not fully describe you, but they do match those used by the Census Bureau. It helps us to know how similar the group of participants is to the U.S. population.

Por favor, indique lo que considere que es su origen racial. Estamos muy agradecidos por su ayuda. Las categorías que utilizamos puede que no lo describan completamente a usted, pero sí que coinciden con las utilizadas por la Oficina del Censo. Nos ayuda a saber cuán similar es el grupo de participantes a la población de EE.UU.

Please check one or more categories below to indicate what race or races you consider yourself to be.

Por favor marque una o más de las siguientes categorías para indicar a qué raza o razas usted se considera pertenecer.

RESPONSE OPTIONS:

- 1 White
- 2 Black or African American
- 3 American Indian or Alaska Native – *Type in name of enrolled or principal tribe.* [TEXTBOX]
- 4 Asian Indian
- 5 Chinese
- 6 Filipino
- 7 Japanese
- 8 Korean
- 9 Vietnamese
- 10 Other Asian – *Type in race* [TEXTBOX]
- 11 Native Hawaiian
- 12 Guamanian or Chamorro
- 13 Samoan

- 14 Other Pacific Islander – *Type in race* [TEXTBOX]
15 Some other race – *Type in race* [TEXTBOX]
- 1 Blanca
2 Negra o Afroamericana
3 Indígena de las américas o nativa de Alaska–*Ingrese el nombre de la tribu en la cual está inscripto/a o tribu principal.* [TEXTBOX]
4 India Asiática
5 China
6 Filipina
7 Japonesa
8 Coreana
9 Vietnamita
10 Otra asiática –*Escriba la raza*[TEXTBOX]
11 Nativa de Hawái
12 Guameña o Chamorra
13 Samoana
14 Otra de las islas del Pacífico – *Escriba la raza* [TEXTBOX]
15 Otra raza – *Escriba la raza* [TEXTBOX]
-

EDUCAT.

What is the highest level of school you have completed?
¿Cuál es el nivel escolar más alto que usted ha completado?

RESPONSE OPTIONS:

1. No formal education
 2. 1st, 2nd, 3rd, or 4th grade
 3. 5th or 6th grade
 4. 7th or 8th grade
 5. 9th grade
 6. 10th grade
 7. 11th grade
 8. 12th grade no diploma
 9. High school graduate – high school diploma or the equivalent (GED)
 10. Some college, no degree
 11. Associate degree
 12. Bachelor's degree
 13. Master's degree
 14. Professional or Doctorate degree
-
1. Educación informal
 2. 1º, 2º, 3º, ó 4º grado
 3. 5º ó 6º grado
 4. 7º ó 8º grado
 5. 9º grado
 6. 10º grado
 7. 11º grado

8. 12º grado SIN DIPLOMA
 9. Graduado de escuela secundaria – diploma de secundaria o su equivalente (GED)
 10. Un poco de universidad, ningún título
 11. Título de asociado
 12. Licenciatura
 13. Maestría
 14. Título profesional o doctorado
-

INCOME.

The next question is about the total income of YOUR HOUSEHOLD for 2019. Please include your own income PLUS the income of all members living in your household (including cohabiting partners and armed forces members living at home). Please count income BEFORE TAXES and from all sources (such as wages, salaries, tips, net income from a business, interest, dividends, child support, alimony, and Social Security, public assistance, pensions, or retirement benefits).

La siguiente pregunta es sobre los ingresos totales de SU HOGAR en 2019. Por favor incluya sus propios ingresos MÁS los ingresos de todos los miembros que residen en su hogar (incluyendo a parejas cohabitantes y miembros de las fuerzas armadas que vivan en su hogar). Por favor cuente los ingresos ANTES DE LOS IMPUESTOS y de todas las fuentes (como sueldos, salarios, propinas, ingresos netos de un negocio, intereses, dividendos, manutención de hijos, pensión alimenticia, y Seguridad Social, asistencia pública, pensiones o prestaciones por jubilación).

RESPONSE OPTIONS:

1. Less than \$5,000
2. \$5,000 to \$9,999
3. \$10,000 to \$14,999
4. \$15,000 to \$19,999
5. \$20,000 to \$24,999
6. \$25,000 to \$29,999
7. \$30,000 to \$34,999
8. \$35,000 to \$39,999
9. \$40,000 to \$49,999
10. \$50,000 to \$59,999
11. \$60,000 to \$74,999
12. \$75,000 to \$84,999
13. \$85,000 to \$99,999
14. \$100,000 to \$124,999
15. \$125,000 to \$149,999
16. \$150,000 to \$174,999
17. \$175,000 to \$199,999
18. \$200,000 or more

1. Menos de \$5,000
2. \$5,000 a \$9,999
3. \$10,000 a \$14,999
4. \$15,000 a \$19,999
5. \$20,000 a \$24,999
6. \$25,000 a \$29,999
7. \$30,000 a \$34,999
8. \$35,000 a \$39,999
9. \$40,000 a \$49,999
10. \$50,000 a \$59,999
11. \$60,000 a \$74,999
12. \$75,000 a \$84,999
13. \$85,000 a \$99,999
14. \$100,000 a \$124,999
15. \$125,000 a \$149,999
16. \$150,000 a \$174,999
17. \$175,000 a \$199,999

[DISPLAY_CONTACT]

So that we can send you rewards and our election surveys, we will be asking you for contact information. We will never share your information with third parties for marketing purposes or mailing lists.

Para poder enviarle los premios y nuestras encuestas electorales, le pediremos información de contacto. Nunca compartiremos su información con terceros para fines de marketing o listas de correo.

Let us explain why we need your email address. For you to participate in the 2020 Election Research Project, we need to be able to send you survey invitations and your rewards to an email address. Please provide your email address to participate in the study. We will use your email address only for the 2020 Election Research Project, and not for any other purposes.

Déjenos explicarle por qué necesitamos su dirección de correo electrónico. Para que usted participe en el Proyecto de Investigación Electoral 2020, necesitamos poder enviarle invitaciones a encuestas y sus premios a una dirección de correo electrónico. Por favor, proporcione su dirección de correo electrónico para participar en el estudio. Utilizaremos su dirección de correo electrónico solo par el Proyecto de Investigación Electoral 2020, y para ningún otro propósito.

We hope you will reconsider and will decide to provide your email address. Please enter your email address to make sure your voice is heard in the 2020 Election Research Project. We look forward to hearing about your opinions!

Esperamos que lo reconsidere y decida proporcionar su dirección de correo electrónico. Por favor, introduzca su dirección de correo electrónico para asegurarse de que su voz se oiga en el Proyecto de Investigación Electoral 2020. ¡Esperamos escuchar sus opiniones!

We will be using the below number to send you SMS texts. Please review and change if necessary.

Usaremos el siguiente número para enviarle un mensaje de texto. Por favor, revíselo y modifíquelo si es necesario.

[FOR ANY CELL PHONE OR UNKNOWN TEL TYPE (IF PHONE=SHOWN AND PHONE1_TYPE=2,77,98,99)]

AUTOTEL

Do you authorize NORC to call you using an automated telephone dialing system for the following phone numbers you have just given to us?

Please note that we will only use your phone number for this study and will not share, sell or otherwise use these numbers without your prior consent. This feature simply allows our phone researchers to get connected to you faster rather than having to manually punch in the number for your cell. Once connected, an actual person will be speaking to you. So, this is **not** robocalling, which auto dials numbers with a prerecorded voice message.

¿Autoriza a NORC a llamarle usando un sistema de marcación telefónica automática para los siguientes números de teléfono que nos acaba de dar?

Por favor tenga en cuenta que sólo utilizaremos su número de teléfono para este estudio y no compartiremos, venderemos ni utilizaremos de ninguna otra forma estos números sin su consentimiento previo. Esta función simplemente permite a nuestros investigadores telefónicos conectarse a usted más rápido en lugar de tener que marcar manualmente el número de su celular. Una vez conectado, una persona real le hablará. Por lo tanto, esto **no** es robocalling, que marca automáticamente los números con un mensaje de voz pregrabado.

DEACTIVATION.

When you agreed to participate in this study, you said you'd be willing to deactivate your [INSERT IF P_SAMPLE_GROUP=3: Facebook][INSERT IF P_SAMPLE_GROUP=4: Instagram] account for 1 to 6 weeks, at a rate of \$25 per week, starting on September 22. During your assigned deactivation period, you can continue to use messenger and WhatsApp[INSERT IF P_SAMPLE_GROUP=3: and log into apps and websites with Facebook]. When the deactivation period starts, we'll automatically deactivate your account, and you'll need to avoid logging back into [INSERT IF P_SAMPLE_GROUP=3: Facebook][INSERT IF P_SAMPLE_GROUP=4: Instagram] for the rest of the period. When you reactivate your account, it will be just as you left it.

Cuando aceptó participar en este estudio, dijo que estaría dispuesto a desactivar su cuenta de[INSERT IF P_SAMPLE_GROUP=3: Facebook][INSERT IF P_SAMPLE_GROUP=4: Instagram] durante 1 a 6 semanas, a cambio de 25 dólares por semana, a partir del 22 de septiembre. Durante el período de desactivación asignado, puede seguir utilizando el mensajero y WhatsApp [INSERT IF P_SAMPLE_GROUP=3: e iniciar sesión en aplicaciones y sitios web con Facebook]. Cuando comience el período de desactivación, desactivaremos automáticamente su cuenta y deberá evitar volver a iniciar sesión en su [INSERT IF

P_SAMPLE_GROUP=3: Facebook][INSERT IF P_SAMPLE_GROUP=4: Instagram] durante el resto del período. Cuando usted reactive su cuenta, estará tal como la dejó.

You will be randomly assigned to deactivate your [INSERT IF P_SAMPLE_GROUP=3: Facebook][INSERT IF P_SAMPLE_GROUP=4: Instagram] for either:

- 1 week, until September 29, for \$25

OR

- 6 weeks, until November 3, for \$150

Se le asignará al azar desactivar su [INSERT IF P_SAMPLE_GROUP=3: Facebook][INSERT IF P_SAMPLE_GROUP=4: Instagram] para:

- 1 semana, hasta el 29 de septiembre por \$25

O

- 6 semanas hasta el 3 de noviembre, por \$150

In both cases you will be paid in mid November and you will be asked to take three surveys for additional payment between October and December. If you are still willing to deactivate for both 1 week or 6 weeks, choose "Yes, Join Study." If not, you will still be paid for this survey but will no longer be part of the study.

En ambos casos se le pagará a mediados de noviembre y se le pedirá que realice tres encuestas para recibir un pago adicional entre octubre y diciembre. Si todavía está dispuesto a desactivar tanto por 1 o 6 semanas, elija "Sí, unirse al estudio". Si no, todavía le pagaremos por esta encuesta pero ya no formará parte del estudio.

RESPONSE OPTIONS:

1. Yes, Join Study
2. No, End Study

RESPONSE OPTIONS:

1. Sí, unirse al estudio
2. No, terminar el estudio

[DISPLAY]
DEBRIEF.

Earlier in this survey we asked you about whether you thought several statements were accurate. We did this because we are trying to understand what information people think is true and false. Before you leave the survey, we wanted to share with you that the following statements are indeed true:

- A new loss of taste or smell is a symptom of COVID-19
- COVID-19 can be spread by people who do not show symptoms

And the following statements are not correct:

- The Chinese government created COVID-19 as a bioweapon
- The medication hydroxychloroquine is proven to cure or prevent COVID-19
- Antibiotics are effective in preventing and treating COVID-19

Al principio de esta encuesta, le preguntamos si pensaba que varias afirmaciones eran precisas. Hicimos esto porque estamos tratando de comprender qué información piensa la gente que es verdadera y falsa. Antes de salir de la encuesta, queríamos compartir con usted que las siguientes afirmaciones son verdaderas:

- Una nueva pérdida del gusto u olfato es un síntoma de COVID-19
- COVID-19 puede ser transmitido por personas que no presentan síntomas

Y las siguientes declaraciones no son correctas:

- El gobierno chino creó COVID-19 como arma biológica
- Se ha comprobado que el medicamento hidroxiclороquina cura o previene el COVID-19
- Los antibióticos son eficaces para prevenir y tratar COVID-19

DISPLAY – OPTINTRO.

We ask you to fill out this survey that will take about 20 minutes. After you complete the survey today, we will be sending you one more survey in early December.

Le pedimos que complete esta encuesta que le tomará unos 20 minutos. Después de que complete la encuesta hoy, le enviaremos una encuesta más a principios de diciembre.

Your participation helps researchers at New York University, The University of Texas at Austin, and other academic institutions, in partnership with Facebook, to learn more about the role of social media in elections in the United States.

Su participación ayuda a los investigadores de la Universidad de Nueva York, la Universidad de Texas en Austin y otras instituciones académicas, en colaboración con Facebook, a aprender más sobre el papel de las redes sociales en las elecciones en los Estados Unidos.

Once this study is over, de-identified data will be stored and shared by Facebook for future research on elections, to validate the findings of this study, or if required by law for an inquiry by the Institutional Review Board (IRB) that reviewed this study.

Una vez que este estudio termine, los datos desidentificados serán almacenados y compartidos por Facebook para futuras investigaciones sobre las elecciones, para validar los resultados de este estudio, o si la ley lo requiere, para una auditoría de la Junta de Revisión Institucional (IRB), la cual revisó este estudio.

There are no benefits to participating in this research, nor are there risks greater than those encountered in everyday life, including risks related to the loss of confidentiality. Your participation is completely voluntary.

No hay beneficios por participar en esta investigación, ni tampoco hay riesgos mayores que los que se encuentran en la vida cotidiana, incluyendo riesgos relacionados con la pérdida de confidencialidad. Su participación es completamente voluntaria.

The Data Collected and Your Privacy If You Choose to Participate in the Study

Los datos recopilados y su privacidad si decide participar en el estudio

- NORC will join your survey responses to publicly available third-party data like if you've voted or made a political contribution, if this data is available
- Facebook will combine this data with your activity on Facebook and Instagram from the 2020 calendar year, collectively called Combined Data
- This Combined Data will only be used for research purposes and will not be used to show you ads
- This Combined Data will be shared with Facebook, their academic partners and, if legally required, with the Institutional Review Board (IRB) that reviewed this study
- All access to this Combined Data will be monitored and logged by Facebook and NORC

- Once this study is over, de-identified data may be stored and shared by Facebook for future research on elections, to validate the findings of this study, or if required by law for an IRB inquiry
- NORC cruzará sus respuestas a la encuesta con datos de terceros disponibles públicamente, como por ejemplo si usted ha votado o hecho una contribución política, si estos datos están disponibles
- Facebook combinará estos datos con su actividad en Facebook e Instagram en el año 2020, colectivamente llamados Datos Combinados
- Estos datos combinados sólo se utilizarán con fines de investigación y no se utilizarán para mostrarle anuncios
- Estos Datos Combinados se compartirán con Facebook, sus socios académicos y, si se requiere legalmente, con la Junta de Revisión Institucional (IRB) que estuvo a cargo de revisar este estudio
- Todo el acceso a estos datos combinados será monitoreado y registrado por Facebook y NORC
- Una vez finalizado este estudio, Facebook puede almacenar y compartir datos anónimos para futuras investigaciones sobre elecciones, para validar los resultados de este estudio o, si así lo exige la ley, para una consulta del IRB

You can decide to stop participating in this study at any time, for any reason, and without consequences. You may withdraw from the study by emailing support@amerispeak.org or calling AmeriSpeak support at (888) 326-9424.

Puede decidir dejar de participar en este estudio en cualquier momento, por cualquier motivo y sin consecuencias. Puede retirarse del estudio enviando un correo electrónico a support@amerispeak.org o llamando a la unidad de soporte de AmeriSpeak al (888) 326-9424.

MISINFO.

Next [CAWI: you will see][CATI: I will read to you] a series of statements about the 2020 election. We'd like to know how accurate you think each of the statements are to the best of your knowledge.

A continuación [CAWI: verá][CATI: le leeré] una serie de declaraciones sobre las elecciones de 2020. Nos gustaría saber cuán precisas cree que son cada una de las declaraciones según su conocimiento.

GRID ITEMS, RANDOMIZE:

- A. Election observers were prohibited from observing the vote count in numerous states.
 - B. Millions of fraudulent mail and absentee ballots were cast.
 - C. The US Postal Service failed to deliver hundreds of thousands of ballots.
 - D. Voting machines were manipulated to add tens of thousands of votes for Joe Biden.
 - E. Tens of thousands of votes were recorded from dead people.
 - F. Immediately after the election, a pharmaceutical company announced that a new coronavirus vaccine is more than 90% effective.
 - G. Donald Trump's campaign held a press conference at a landscaping company next to an adult book store.
 - H. Donald Trump improved his vote share among Hispanic voters in Florida compared to 2016.
 - I. Church bells rang in Paris to celebrate Joe Biden's victory.
 - J. First lady Melania Trump put out a statement in the week after the election saying this would be her final Christmas in the White House.
- A. Se prohibió a los observadores electorales observar el recuento de votos en numerosos estados.
 - B. Se emitieron millones de votos fraudulentos por correo y de votación ausente.
 - C. El Servicio Postal de los Estados Unidos fracasó en enviar cientos de miles de boletas electorales.
 - D. Las máquinas de votación fueron manipuladas para agregar decenas de miles de votos a Joe Biden.
 - E. Se registraron decenas de miles de votos de personas fallecidas.
 - F. Inmediatamente después de las elecciones, una compañía farmacéutica anunció que una nueva vacuna contra el coronavirus tiene una efectividad superior al 90%.
 - G. La campaña electoral de Donald Trump celebró una conferencia de prensa en una empresa de jardinería junto a una librería para adultos.
 - H. Donald Trump mejoró su porcentaje de votos entre los votantes hispanos en Florida en comparación con 2016.
 - I. Las iglesias en París tocaron sus campanas para celebrar la victoria electoral del Joe Biden.
 - J. La primera dama Melania Trump emitió un comunicado la semana después de las elecciones informando que esta sería su última Navidad en la Casa Blanca.

Next, we ask for your help on a different part of the November 2020 US Election study that you are a research participant in.

A continuación, le pedimos su ayuda en una investigación voluntario relacionado con una parte diferente del estudio sobre las elecciones de noviembre de 2020 en los Estados Unidos en el que usted es un participante en la investigación.

The goal of this part of the study is to develop an understanding of how people participate in elections, such as by voting or donating to political campaigns. As a result, we would like to ask you to allow NORC to collect publicly available third-party data on whether you've voted or made a political contribution, if that data is available.

El objetivo de esta parte del estudio de desarrollar una comprensión de la forma en que las personas participan en las elecciones, por ejemplo, votando o haciendo donaciones a campañas políticas. Como resultado, nos gustaría pedirle que permita a NORC datos de terceros disponibles públicamente sobre si ha votado o hecho una contribución política, si esos datos están disponibles.

[SHOW IF P_CONSENTW4=MISSING]
[SP]

CONSENT_REG. The Data Collected and Your Privacy If You Choose to Participate in this part of the Study
Los datos recopilados y su privacidad si decide participar en esta parte del estudio

- NORC will collect publicly available third-party data on whether you've voted or made a political contribution, if this data is available
- NORC will share this data on your voting and donation history with Facebook and exclude data that may directly identify you such as your name
- Facebook will join the third-party data it receives from NORC with data you previously consented to sharing for the November 2020 US Election research study (such as your survey data, and/or device data, as applicable), collectively called Combined Data
- This Combined Data will only be used for research purposes and will not be used to show you ads
- This Combined Data will be shared with Facebook's academic partners and, if legally required, with the Institutional Review Board (IRB) that reviewed this study
- All access to this Combined Data will be monitored and logged by Facebook
- Once this study is over, de-identified data (i.e. data where identifiers such as your name and other information that could reasonably be linked to you are removed) will be stored and shared by Facebook for future research on elections, to validate the findings of this study, or if required by law for an IRB inquiry

- NORC crecogerá datos de terceros disponibles públicamente sobre si usted ha votado o hecho una contribución política, si estos datos están disponibles
- NORC compartirá estos datos sobre su historial de votación y donaciones con Facebook y excluirá los datos que puedan identificarlo directamente, como su nombre.
- Facebook unirá a los datos de terceros que recibe de NORC con los datos que previamente consintió en compartir para el estudio de investigación de las elecciones de noviembre de 2020 en los Estados Unidos (como los datos de su encuesta, y/o los datos del dispositivo, según corresponda), llamados colectivamente Datos Combinados
- Estos datos combinados sólo se utilizarán con fines de investigación y no se utilizarán para mostrarle anuncios
- Estos Datos Combinados se compartirán con los socios académicos de Facebook y, si se requiere legalmente, con la Junta de Revisión Institucional (IRB) que estuvo a cargo de revisó este estudio
- Todo el acceso a estos datos combinados será monitoreado y registrado por Facebook
- Una vez finalizado este estudio, los datos desidentificados (es decir, en los que se eliminan los identificadores como su nombre y otra información que podría estar razonablemente vinculada a usted) serán almacenados y compartidos por Facebook para futuras investigaciones sobre elecciones, para validar los resultados de este estudio o, si lo requiere la ley para una investigación de la IRB

The Data Collected and Your Privacy If You Choose to Participate in the Study

Los datos recopilados y su privacidad si decide participar en el estudio

- NORC will join your survey responses to publicly available third-party data like if you've voted or made a political contribution, if this data is available
- Facebook will combine this data with your activity on Facebook and Instagram from the 2020 calendar year, collectively called Combined Data
- This Combined Data will only be used for research purposes and will not be used to show you ads
- This Combined Data will be shared with Facebook, their academic partners and, if legally required, with the Institutional Review Board (IRB) that reviewed this study
- All access to this Combined Data will be monitored and logged by Facebook and NORC
- Once this study is over, de-identified data may be stored and shared by Facebook for future research on elections, to validate the findings of this study, or if required by law for an IRB inquiry

- NORC cruzará sus respuestas a la encuesta con datos de terceros disponibles públicamente, como por ejemplo si usted ha votado o hecho una contribución política, si estos datos están disponibles
- Facebook combinará estos datos con su actividad en Facebook e Instagram en el año 2020, colectivamente llamados Datos Combinados
- Estos datos combinados sólo se utilizarán con fines de investigación y no se utilizarán para mostrarle anuncios
- Estos Datos Combinados se compartirán con Facebook, sus socios académicos y, si se requiere legalmente, con la Junta de Revisión Institucional (IRB) que estuvo a cargo de revisar este estudio
- Todo el acceso a estos datos combinados será monitoreado y registrado por Facebook y NORC
- Una vez finalizado este estudio, Facebook puede almacenar y compartir datos anónimos para futuras investigaciones sobre elecciones, para validar los resultados de este estudio o, si así lo exige la ley, para una consulta del IRB

You can decide to stop participating in this study at any time, for any reason, and without consequences. You may withdraw from the study by emailing support@amerispeak.org or calling AmeriSpeak support at (888) 326-9424.

Next, we ask for your help on another different part of the November 2020 US Election Study that you are a research participant in.

A continuación, le pedimos su ayuda en otra parte diferente del estudio de las elecciones de noviembre de 2020 en los Estados Unidos. en el que usted es un participante de la investigación.

As social media plays an increasing role in society, we would like to know who uses Twitter, and how people use it. The overarching goal of this part of the study is to develop an understanding of people's

use of social media during the lead up to and after the 2020 US elections. As a result, we would like to ask you to share your Twitter account handle with NORC and verify that it's yours so we may look at what you have publicly posted, commented on, followed, and engaged with on Twitter.

Como los medios sociales juegan un papel cada vez más importante en la sociedad, nos gustaría saber quién usa Twitter y cómo lo usa la gente. El objetivo general de esta parte del estudio es desarrollar una comprensión del uso de los medios sociales por parte de la gente durante el período previo y posterior a las elecciones estadounidenses de 2020. Como resultado, nos gustaría pedirle que comparta su nombre de usuario de Twitter con NORC y verifique que es suya para que podamos ver lo que ha publicado, comentado, seguido y participado con públicamente en Twitter.

If you link your Twitter account, you will receive an additional [INSERT IF PANEL_TYPE<20: 5,000 AmeriPoints][INSERT IF PANEL_TYPE=22,23: \$5].

Si usted conecta su cuenta de Twitter, recibirá [INSERT IF PANEL_TYPE<20: 5,000 AmeriPoints][INSERT IF PANEL_TYPE=22,23: \$5] adicional.

The Data Collected and Your Privacy If You Choose to Participate in this part of the Study

Los datos recopilados y su privacidad si decide participar en esta parte del estudio

- NORC will collect data from your Twitter account that is publicly available. This will include your account information from July 1, 2020 through December 31, 2020, such as your profile description, who you follow and who follows you, the content of your tweets (including text, images, videos and web links), and background information about your tweets (such as when you tweeted, what type of device you tweeted from, and if enabled, the location the tweet was sent from)
- NORC will share your Twitter data with Facebook and exclude data that may directly identify you such as your Twitter handle or display name
- Facebook will join the Twitter data it receives from NORC with data you previously consented to sharing for the November 2020 US Election research study (such as your survey data, publicly available third-party data, your activity on Facebook and Instagram from the 2020 calendar year, and/or device data, as applicable), collectively called Combined Data
- This Combined Data will be shared with Facebook's academic partners and, if legally required, with the Institutional Review Board (IRB) that reviewed this study
- This Combined Data will only be used for research purposes and will not be used to show you ads
- All access to this Combined Data will be monitored and logged by Facebook
- Once this study is over, de-identified data (i.e. data where identifiers such as your name and other information that could reasonably be linked to you are removed) will be stored and shared by Facebook for future research on elections, to validate the findings of this study, or if required by law for an IRB inquiry
- NORC recogerá datos de su cuenta de Twitter que estén disponibles públicamente. Esto incluirá información de su cuenta desde el 1 de julio de 2020 hasta el 31 de diciembre de 2020 como la descripción de su perfil, a quién sigue y quién le sigue a usted, el contenido de sus tweets (incluyendo texto, imágenes, vídeos y enlaces web), e información de fondo sobre sus tweets

(como cuándo hizo el tweet, desde qué tipo de dispositivo lo hizo y, si está configurado, la ubicación desde la que se envió el tweet)

- NORC compartirá sus datos de Twitter con Facebook y excluirá los datos que puedan identificarlo directamente, como su nombre de usuario en Twitter o nombre de perfil
- Facebook unirá los datos de Twitter que recibe de NORC con los datos que usted puede haber consentido previamente en compartir para el estudio de investigación de las elecciones de noviembre de 2020 en los Estados Unidos (como los datos de su encuesta, los datos de terceros disponibles públicamente, su actividad en Facebook e Instagram a partir del año calendario 2020, y/o los datos del dispositivo, como corresponda), denominados colectivamente Datos Combinados
- Estos Datos Combinados serán compartidos con los socios académicos de Facebook y, si se requiere legalmente, con la Junta de Revisión Institucional (IRB) que revisó este estudio
- Estos datos combinados sólo se utilizarán para fines de investigación y no se usarán para mostrarle anuncios
- Todo acceso a estos Datos Combinados será monitoreado y registrado por Facebook
- Una vez finalizado este estudio, los datos des-identificados (es decir, los datos en los que se eliminan los identificadores como su nombre y otra información que podría estar razonablemente vinculada a usted) aún serán almacenados y compartidos por Facebook para futuras investigaciones sobre las elecciones, para validar los resultados de este estudio, o si lo requiere la ley para una investigación de la IRB
